'Yes; we do not see Reekton for the first time under favourable circumstances. Who could have foreseen a day like this after so bright a morning! Are you cold?'

'Yes; no—a little, I think.'

'Shall I go into the inn as we pass, and tell them to have a chop or something ready for us, in case Mr Moffat may be from home?'

'That would be the finishing stroke to our bad luck! Very likely we shall find he is away.'

However, it seemed as if Fate meant to be kind after all; for on knocking at the door of the house pointed out to them, a stout, severe-looking person informed them that Mr Moffat was at home. 'I'm no sure if he is down yet; but just step in here,' said she, opening, as she spoke, a door on the left side of the little square passage; 'he's mostly late on the Mondays'—and ushered them into a room where breakfast was laid for one person.

On a side-table was lying a strange mixture of books and pamphlets, pipes in great variety, tins of tobacco, match-boxes, and a dirty-looking smoking-cap; and on the floor a japanned spittoon. The window had evidently not been opened that day, and an effluvia from last night's tobacco still pervaded every corner. A greasy arm-chair stood on one side of the fireplace, and near it a pair of walking-boots ready for their owner; under the chair, a pair of very much worn green-and-white Berlin-work slippers. The servant never thought of asking their names, an omission which secretly pleased Walter very much, and she had left the door of the room in which they were, open, so they had the gratification of hearing her go across the passage and up the narrow stairs, and knock at a door apparently right over them.

'You're wanted in the parlour,' said the severe-looking person.—'Who is it?' came from a man's voice.—'I dinna ken them,' she replied, more than half-way down-stairs, evidently.

Walter carefully avoided looking at his sister,

as a certain muffled thumping, announced the approach of some one who evidently had no shoes on his feet; but he furtively glanced at his watch, and saw that it was almost one o'clock. And then the door was pushed open, and he saw a short, thick-set man, with a high and shining forehead, and general air of untidiness, enter, and suddenly stand as if petrified. A few desperately awkward seconds passed.

At length Walter came forward. 'We must apologise for invading your premises in this manner, Mr Moffat.—Clare, introduce me.'

Clare contrived to mutter a few words; and Walter held out his hand, which, he felt, was by no means cordially grasped by his host; but he continued: 'My sister and I only thought of this little visit late last night, and so we couldn't let you know of it.'

Clare and Mr Moffat had silently got through the ceremony of shaking hands by this time; and the girl, nearly upset by the whole morning's experience, was glad to take the nearest chair, which happened to be the arm-chair under which Mr Moffat's slippers were lying, so that that unfortunate man—as if to put and keep him at a still greater disadvantage—was forced to entertain his unexpected guests with no other covering to his large and badly shaped feet than that afforded by coarse homespun stockings.

In vain Walter essayed his most genial manner; nothing could make the visit other than a wretchedly awkward one. Clare seemed unable to utter a syllable, and averted her eyes carefully from the man's unslippered feet and unshaven face. At length, seeing that her powers of endurance were being tried to the uttermost by various unhappy attempts on Mr Moffat's part to assume the tone of an accepted lover, Walter suggested that they should leave Mr Moffat to eat his breakfast in peace, while they would go back to the inn for the lunch which must be awaiting them, and invited Mr Moffat to join them there as soon as was convenient for him, and spend the rest of the time with them until the train was due by which they were to return.

On getting out into the street, Clare convulsively clasped her brother's arm. 'Walter, could we not get a train sooner than three o'clock?'

'I am afraid not. But do you know it is almost two o'clock, now!—the time will soon pass. It is this wretched weather that makes everything look so miserable.'

Clare shivered, and wished she were away.

On reaching the inn, they found their lunch waiting for them; but the chops were tough, and had been burned in the process of cooking, and Clare at least found it impossible to eat. A large party of convivial miners were in the next room, which was only separated from theirs by a thin wooden partition, and they had the benefit of the jokes, oaths, and squabbles that passed among them. Mr Moffat was some time in making his appearance; but when he did, he was much more presentable, more like the man Clare had seen and believed in, at her own home. But his shaven face and correct clerical costume came too late, and he was sensible enough to see the matter in its true light. Nothing could re-establish him again on the pinnacle to which Clare, in her uncurbed imagination and secret love of excitement under any form, had raised him.

On getting home, Walter explained to his mother that she had no longer anything to fear; and next day wrote to Mr Moffat, by his sister's desire, breaking off all further connection; and then telegraphed to his wife to expect him and his mother and sister the following day.

Georgie remained under the impression that her mother-in-law's state of health required a change. Not even to her did Walter ever divulge the severe practical lesson to which he had subjected his sister; not even, when he had the gratification of seeing her make a suitable and happy marriage within a year or two from the time when her self-will and self-ignorance had so nearly wrecked her life.

## BRIGAND NOTES.

A BLUE-BOOK about brigandage is a novelty; but it is not at all exciting reading. The Return, lately presented to parliament, of British subjects who have been taken captive by brigands in foreign countries, is a very business-like production, proving that if there was ever any romance attached to the lawless calling, it has long since vanished; the only difference between the brigand and the common thief being, that the latter is contented with divesting his victim of his portable belongings, while the former holds him a prisoner until ransom is paid.

Since 1860, there have been fourteen cases of brigandage in which subjects of Her Majesty were concerned, Spain being discredited with four, Mexico three, Italy three, and Greece and Turkey two each. On the 21st of May 1870, Messrs John and Anthony Bonell were captured in Spanish territory, near Gibraltar; obtaining their release, after a short detention, by paying down twenty-seven thousand dollars, obtained from the governor of Gibraltar, who was afterwards repaid by the Spanish government. On the 18th of March 1871, Mr and Mrs Ranken, and Mrs Taylor, fell into the clutches of some brigands near Denia, but were fortunately able to part company at once; the adventure costing them two hundred pounds. In July 1874, Mr Haseldin met with like ill-fortune near the Rio Grande Mines, in the Sierra Morena; but did not get off quite so easily. His captors demanded four millions of reals, or something like forty thousand pounds; but softened by their prisoner's expostulations, offered to set him at liberty for a quarter of that amount. He still considered the price too high, and remained in durance for nine days; when finding they could do no better, they accepted six thousand pounds, and bade Mr Haseldin good speed. Mr Rouse, who was taken near Huelmo-luencina, on the 3d of May 1875, was yet luckier, being only detained a few hours, while his servant fetched a hundred thousand reals—about a thousand pounds—which he was well content to pay for freedom.

Mexican brigands would seem to be satisfied with a lower rate of ransom. It is true that they kept Mr Rabling a prisoner for three weeks, in November 1863, in the vain hope of extracting six thousand dollars out of his friends' pockets; but finding so much was not forthcoming, they eventually accepted three thousand four hundred dollars and twelve muskets. In the same month, two years later, Mr Mirillies was seized by an

armed band, near Irapuato. He was told he was a prisoner to the army of the Liberal General Antillon; but Mexican soldiers and Mexican brigands are hardly to be distinguished, and it mattered very little which they were, since they would not let him take his leave under less than two thousand dollars; a sum he was fain to raise, after four days' experience of their society. Four days' grace was not allowed to Mr Furber, who was captured near Guanaxato, on the 19th of December 1869; for the day after his capture the body of the unfortunate man was found, having a paper attached to it, informing all whom it might concern that he had been put to death for refusing to purchase his life for five thousand dollars.

A traveller would naturally think himself safe from such gentry when within hail of a city of renown like Florence. Mr Deale was taught otherwise sixteen years ago, when he found himself in the hands of a band, and his liberty valued at twelve thousand scudi. He lived, however, to laugh at them; for in twenty-four hours his guards let him depart in peace, thanks to an erroneous notion that their comrades had received the money. The captors of the Rev. J. C. M. Ansley, Mr Moens, and their respective better-halves, made a more profitable haul. Setting the ladies at liberty at once, they allowed the clergyman to leave the camp the following day, detaining Mr Moens as hostage for the ransom of eight thousand five hundred pounds. Mr Ansley sought the assistance of our consul at Naples, and after a deal of negotiation, obtained his friend's release on payment of five thousand one hundred pounds. Mr Forester Rose found his Palermitan captors more reasonable. At first, they asked five thousand pounds; seeing this sum was unattainable, they came down to two thousand, and eventually accepted sixteen hundred pounds; but as the firm to which he belonged spent eight hundred pounds in expenses attending the affair, and had to suspend business till the matter was settled, they considered they paid dearly enough for their partner's visit to Lecara.

In 1865, Mr Corre was a nine days' involuntary guest of a band of Greek brigands, waiting for his companions in misfortune, Lord John Hervey and the Hon. H. Strutt, to send the three thousand pounds they had agreed to pay for their lives. When, in April 1870, Lord and Lady Muncaster, Mr Vyner, Mr Herbert, Mr and Mrs Lloyd, and their child were captured some twelve miles from Athens, the brigands demanded no less than fifty thousand pounds as the price of the little party's release; but afterwards reduced the terms to twenty-five thousand pounds and a free pardon. In the end, they got nothing. Suffering the ladies to return to Athens with the child within a few hours of the capture, they released Lord Muncaster two days afterwards, in order that he might arrange about the payment of the ransom. The sum demanded was out of the question; and a correspondence ensued between the brigands and the British and Italian ministers, whose efforts to bring about an arrangement were aided by those of a member of the Greek government. They failed to come to terms; and growing impatient, on the 25th of April the brigands cruelly murdered Mr Herbert, Mr Vyner, and Mr Lloyd. The widow of the last-named received a thousand pounds from the king of Greece to supply her

immediate wants; and the Greek government ultimately paid an indemnity of ten thousand pounds—the only instance of the kind recorded in the Return, which ends with mentioning the two cases of brigandage in Turkey, wherein Colonel Syngé and Mr and Mrs Suter figured, with the remark that they are 'not concluded'; the British government hoping, we suppose, to induce the Porte to repay the ransom money—nearly twenty-five thousand pounds—which it advanced, rather than leave the issue in the hands of the brigands. Such help will not be forthcoming again, the Foreign Secretary having notified Her Majesty's representatives abroad of the determination of the government henceforth to advance no money for the release of any save official personages from captivity among brigands.

#### THE ROUND OF LIFE.

Two children down by the shining strand,  
With eyes as blue as the summer sea,  
While the sinking sun fills all the land  
With the glow of a golden mystery:  
Laughing aloud at the sea-mew's cry,  
Gazing with joy on its snowy breast,  
Till the first star looks from the evening sky,  
And the amber bars stretch over the west.

A soft green dell by the breezy shore,  
A sailor lad and a maiden fair;  
Hand clasped in hand, while the tale of yore  
Is borne again on the listening air.  
For love is young, though love be old,  
And love alone the heart can fill;  
And the dear old tale that has been told  
In the days gone by, is spoken still.

A trim-built home on a sheltered bay;  
A wife looking out on the glistening sea;  
A prayer for the loved one far away,  
And prattling imps 'neath the old roof-tree;  
A lifted latch and a radiant face  
By the open door in the falling night;  
A welcome home and a warm embrace  
From the love of his youth and his children bright.

An aged man in an old arm-chair;  
A golden light from the western sky;  
His wife by his side, with her silvered hair,  
And the open Book of God close by.  
Sweet on the bay the glowing falls,  
And bright is the glow of the evening star;  
But dearer to them are the jasper walls  
And the golden streets of the Land afar.

An old churchyard on a green hillside,  
Two lying still in their peaceful rest;  
The fisherman's boats going out with the tide  
In the fiery glow of the amber west.  
Children's laughter and old men's sighs,  
The night that follows the morning clear,  
A rainbow bridging our darkened skies,  
Are the round of our lives from year to year!

## THE ORIGIN OF SOME SOCIAL CUSTOMS.

A CONSIDERABLE portion of our lives is regulated by certain rules of behaviour, which at first sight appear to be merely arbitrary conventions consciously chosen as symbols of respect and goodwill. Mr Spencer, in his book on *Ceremonial Institutions*, shows that these formal observances—ceremonies of state, religion, and social life—are not thus deliberately chosen, but have their origin in spontaneous manifestations of emotion, from which they gradually evolve, as a natural product of social life. The manners and customs of mankind in all parts of the world, concerning which Mr Spencer gives a vast amount of interesting information, illustrate the various phases through which many of the 'conventions' of modern life have passed in this process of evolution.

A good example of the gradual evolution of a seemingly arbitrary convention, is afforded by Mr Spencer's explanation of the simplest form of salute—the familiar nod. An Englishman passing a friend in the street greets him with a slight nod. Why? Because it is the custom. But why has custom adopted this particular form of salute? Let us follow Mr Spencer as he traces it from its origin. A dog afraid of being beaten, crouches before his master. A small dog alarmed at the approach of a big one, sometimes throws itself down, and rolls over on its back. Both these actions are signs of submission—spontaneous expressions of a desire to conciliate the more powerful. That this is their true interpretation, there can be little doubt, on comparing them with the parallel behaviour of some uncivilised tribes. In an African tribe visited by Livingstone, by way of salute 'they throw themselves on their backs on the ground, and rolling from side to side, slap the outside of their thighs, as expressions of thankfulness and welcome.' Here we have the spontaneous expression of two elements of propitiatory behaviour—submission to a superior, and joy at his presence. In other tribes, this complete form of obeisance is abridged, and various modifications of it are found. Prostration on

the face is common. A slight further abridgment of this gives us the attitude of kneeling while the head rests on the ground. 'In past ages, when the Emperor of Russia was crowned, the nobility did homage by bending down their heads, and knocking them at his feet to the very ground.' A further modification is produced by the desire to do homage while approaching a superior. In Dahomey, they 'crawl like snakes, or shuffle forward on their knees.' This brings us to the attitude of going on all-fours; and a still further modification gives the attitude of kneeling. Slightly less abject is kneeling on one knee; and the next step is merely bending the knee. The Japanese 'salute a superior by kneeling; but in the street, merely make a motion as if they were going to kneel.' This action survives among ourselves as the courtesy. Next, omitting the bend of the knee, all that remains is the bend of the body which accompanied the more complete salutes: hence we get the bow, indicating respect; and this passes by insensible transitions from the humble salaam of the Hindn to the familiar nod of an intimate friend. The transition is so gradual, and the intermediate phases so abundantly exemplified, that it is impossible to doubt that such is the true derivation of this trivial act of modern etiquette.

Similar in origin is the raising of the hat as a respectful salute. In primitive states, the conquered man surrenders himself, his weapons, and whatever of his clothing is worth having; hence, stripping becomes a mark of submission. Cook, for instance, relates of some Tahitians, 'they took off a great part of their clothes, and put them on us.' In another tribe, this ceremony is abridged to the presentation of the girdle only. In Abyssinia, inferiors strip to the girdle before superiors. A further abridgment is found among the natives of the Gold Coast, who salute Europeans by slightly removing their robe from the left shoulder; but even there, special respect is shown by completely uncovering the shoulder. In other tribes, they also doff the cap. Hence, it seems that 'the removal of the hat among European

peoples, often reduced among ourselves to touching the hat, is a remnant of that process of unclothing himself, by which in early times the captive expressed the yielding up of all he had.

Not less interesting is Mr Spencer's explanation of the origin of shaking hands. From kissing as a natural sign of affection, to kissing the hand as a compliment, the transition is easy, and requires no further explanation; for a simulation of affection, no less than submission, is an essential part of propitiatory ceremony. 'If, of two persons, each wishes to make an obeisance to the other by kissing his hand, and each, out of compliment, refuses to have his own hand kissed, what will happen? Just as, when leaving a room, each of two persons, proposing to give the other precedence, will refuse to go first, and there will result at the doorway some conflict of movements, preventing either from advancing; so, if each of two tries to kiss the other's hand, and refuses to have his own kissed, there will result a raising of the hand of each by the other towards his own lips; and by the other, a drawing of it down again; and so on alternately. Clearly, the difference between the simple squeeze, to which this salute is now often abridged, and the old-fashioned hearty shake, exceeds the difference between the hearty shake and the movement that would result from the effort of each to kiss the hand of the other.'

Kissing, we have said, is a natural expression of affection; and it is curious to note the analogous manifestations among animals and some of the lower tribes of men. A dog displays his affection for his master by licking his hand. A ewe distinguishes her lamb by the olfactory sense, and apparently derives pleasure from its exercise. The same sense is used among men not only to distinguish, as in the case of Jacob and Isaac, but also as a mark of affection. Among the Mongols, for instance, it is found as 'a mark of paternal affection, instead of embracing;' while the Burmese 'do not kiss each other in the Western fashion, but apply the lip and nose to the cheek, and make a strong inhalation.'

Among ceremonies connected with marriage, the following deserve notice: 'In China, during a wedding visit, each visitor prostrated himself at the feet of the bride, and knocked his head on the ground, saying: "I congratulate you—I congratulate you!" whilst the bride, also on her knees, and knocking her head upon the ground, replied: "I thank you—I thank you!"'

The following ceremony is scarcely what we usually associate with ceremonious treatment, though in certain fishing villages in Scotland a somewhat similar practice is still observed: 'At Arab marriages there is much feasting, and the unfortunate bridegroom undergoes the ordeal of whipping by the relations of his bride.' This is usually explained as a test of courage; but Mr Spencer looks upon it as a survival from more barbarous times, when brides were frequently carried off by force; and the rough treatment which the bridegroom receives is a lingering modification of the resistance of the bride's friends. This explanation suggests a question about one of our own well-known customs, namely, that of pelting the bridegroom with shoes and rice. Are these harmless missiles representatives of the

weapons used to repel the invading bridegroom in earlier times?

The inconsistency between the Chinese custom of wearing white clothing as mourning and the customary black of European nations, seems at first sight to indicate a clear case of an arbitrary convention; but it is fully accounted for on the evolution principle. A mourning dress would naturally be of coarse texture, and, among pastoral peoples, hair would be the most available material for the purpose; the hair used being commonly dingy, darkness of colour became the conspicuous feature of mourning. In a crowded agricultural population, on the other hand, where animals available for the purpose are comparatively rare, and hair consequently costly, cotton was the material that naturally established itself as the mourning colour.

Mr Spencer's book abounds in interesting information about the ceremonies of people in all parts of the world; but the foregoing examples will suffice to illustrate the method by which many of the so-called 'conventions' of civilised life are shown to be 'natural products of social life.' In these days, there is a tendency to disregard ceremonial observances; but it is well to remember that, as a check to 'rudeness of behaviour, and consequent discord,' ceremonial restraints exercise a control which cannot well be spared, until 'mutual forbearance and kindness in society,' which form the true principle of social behaviour, are sufficiently extended to supersede them.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XLVIII.—THE CONFESSION.

'Now, Mr Oakley, and you, Squine, or Right Worshipful, or whatever it is—I've lived so long under a foreign sky, and got into scrapes in so many places—I may own to it now—What am I prating about? No; I'm not light-headed!' added Nat Lee sharply, as if he divined the thoughts of those who stood by his bedside. 'Mind's as clear as a bell; the doctor can tell you that.'

'It is true; he is not delirious,' whispered the house-surgeon, who had been invited to be present at the taking of the dying man's deposition.

Bertram had been fortunate enough to find a magistrate, a friend of Mr Mervyn's, and to whom he was himself personally known, at home; and this gentleman, hearing that the case was urgent, had willingly accompanied him to the Accident Ward of St Bartholomew's. Writing materials were ready; and nothing but the increasing weakness of the patient, and his propensity to ramble in his talk, retarded the business of the hour.

'When I was a youngster at Dulchester, my native place, and where you'll see in the churchyard head-stones with the name of Lee, thickish yet,' said the adventurer huskily, 'I was a clerk in the Old Bank. The banker was Mr Denham, a rich man, with two sons. One of them, the doctor, I scarcely knew when I met him in the High Street. The other was Walter Denham; and perhaps, if I had known no more of him than I did of his honest elder brother, I might not have been lying here to-day, the victim of a gambling brawl, for a dog's death, and a pauper's burial. But that's neither here nor there. To my sorrow, I did know Mr Walter, who was older than myself,

and a dandy—a swell, as they say now—and better supplied with pocket-money. He was a young man of fashion, we thought; and I, an ambitious lad, who courted pleasure. He it was who egged me on to bet my money on races, to play cards, to ruin myself, in the hope of winning; and when I found myself with empty pockets, he lent me small sums on my IOU, which he was always careful to keep me in remembrance of—*very* careful!

‘I did not understand at the time that Mr Walter Denham wished to get me, by his encouragement of my extravagance and by his loans, entirely into his power, seeing in me, no doubt, a tool that would be useful for the work he had in hand. Another instrument he secured too. This was a former school-fellow and fellow-clerk of mine, Henry Crawley—Judas was his nickname in the playground—a sly, sneaking fellow, that would have robbed his father; he did rob his old grandmother, who brought him up, him and his sisters—and boasted of it! Yes; I was bad enough; but Crawley was of a blacker feather than even myself. I was no thief then, only a scamp, mind you; but Crawley was more advanced; and that was how Mr Walter had a hold upon him. He had altered the figures of a cheque, and Mr Walter had found it out—by accident, I believe—and held the knowledge of it over him like a rod in pickle. One word to the old banker, who was a stern man, and it would have been cropped hair and gyves and the convict-ship for Crawley.

‘Well, to cut a long story short, this is what Mr Walter wanted. He wanted to supplant his brother the doctor—whom the old man, our master, had always declared to be his future heir—and to get the property for himself. His brother, the story went, had been kind to him—saved him from drowning once—got him reconciled to his father more than once. But Gold was the god Walter Denham worshipped; and when his father’s last illness came on, and the proud old gentleman would not admit how ill he was, but tried to go about as usual, and sent no message to summon his eldest son, Mr Walter, the plotter, resolved to act. He knew where his father’s will—giving the bulk of the large property to his first-born son—was kept. It was in an iron safe, too strong to be forced. The key was a patent one—thought also to defy imitation. Now it was that Mr Walter made use of his tools, of the two unscrupulous young clerks he had under his thumb. I—I may say so now—was a dab at mechanics, learned a trade as a chicken learns to peck; the joiner’s work, or the smith’s, was as child’s play to me. At locks, I was especially clever, and vain of my knowledge.

‘Crawley, on the other hand, was a beautiful penman. Engrossing, as the lawyers call it, is not an easy task for those who don’t get their bread by it; but Judas could do it as well as you could have the job performed by any law-stationer in London. And the signatures too! He had practised old Mr Denham’s a hundred and a thousand times, until it was perfect. But all Crawley’s skill was of no good unless we could get the true will out of its hiding-place in the safe, and copy it, with the names of the witnesses, and the exact date, and only such alterations as were necessary to make Walter, instead of William,

the residuary legatee. And I toiled and filed and snipped at the picklock, while still the old banker tottered about, with death in his face, but uncomplaining, and resolute not to take to his bed, till he was forced to give way.

‘At last I succeeded. The heavy iron door of the safe swung back, at the touch of the skeleton-key of my making; and Crawley sat up all night to write the false will. It was a marvel of patient dexterity. The witnesses’ signatures—those of the testator—were marvellously imitated. And, after all, we were only just in time. Forty-eight hours after the ink was dry, old Mr Denham was stricken by the hand of death. The fraud was complete, and remained un-disputed.

‘Dr Denham, without a doubt, relinquished the property—it was a large one—to his known of a brother; and Walter Denham was rich—but—but— He paused, gasping. It was not until cordials had been administered, and a short interval for repose, at the surgeon’s suggestion, allowed, that the dying man was able to speak on. And when he did speak, it was in a thin, reedy voice, far feebler than before.

‘Where was I?’ he said faintly.—‘Ah, yes; I remember now. Well, Mr Walter was rich; and we, who had helped him, thought that we had built up our own fortunes in building his. We didn’t quite trust him, though, and we kept back the original will, the true one, instead of giving it up to him, as he wanted, to be burned. Crawley’s notion that was. He swore to Mr Walter that he had destroyed the will, in a panic, he said, and for fear the thing should ever come to light. I don’t think Walter Denham ever believed in the truth of that story; but he spoke us fair; it was his interest to do that; and we had money from him at the first, but not much—not much.

‘The Fiend, they say—it was among Spaniards, in Cuba, I heard that—a superstition set, the Don, you know—has a habit of taking human shape to buy men’s souls, and an ugly knack, too, of cheating them out of the purchase-money. I could almost believe, looking back on a wretched life, that Walter Denham, with his smooth tongue, had bought mine for a song. It was but dog’s wages I got from him—a little cash, and many excuses, and then another dribble, and then grave looks and the cold-shoulder. He used to protest that he was straitened for money. I believe it was partly true. The old man, his father, had invested much capital in mining property and foreign securities that could not be at once realised; and then Walter Denham, for all his fits of extravagance, was a miser at heart.

‘Well, he was rid of me, cheaply—only too cheaply; for I went abroad, knocked about the world, always hunting the Will-of-the-Wasp Fortune; and through much mire and many changes did the jade lead me, till I came back, a middle-aged man, to England. Then I tried my old employer—accomplice, if you like—Mr Walter; and he all but snapped his fingers in my face. When I grew desperate, he loosed his purse-strings a bit; but at best it was a drop in the ocean, a crust flung to a dog. Crawley, sly hunk as he was, fared little better; but then Judas was a coward, and traded, too, on his varnish of respectability. Mr Walter always pleaded poverty—misers are sure to do it—had lost by specula-

tions, he said. It may have been so. My belief is that he doesn't quite know, from habit, when he tells the truth and when not. I feel a warning—time short, and nearly up'— He ceased to speak, and even the wine they gave him revived his falling strength but partially. 'Write down my address,' he made shift to say, after a pause—'Number nine Chapel Street, Hoxton Road—decent crib enough—the last place in which the police—the landlady will let you have my traps, when you prove to her where, and how, I was struck off the roster—and I have got'—

'The will?' suggested Bertram, stooping over the bed.

'No; not the will. Judas—I mean Crawley—was a deal too close-fisted a customer to part with that, and he has got it with him still, I know. No; but the key is there—and—the rough draft of the will, in Crawley's hand, and notes from him and Mr Walter both—kept against a rainy day. I am going fast!' And he really did seem to be going, as a foundering ship, low in the water, and settling by the head, prepares for the last dread plunge.

'But Crawley—his address—you have not told us that?' said the magistrate.

The sick man's energy revived a little. 'Notting Hill,' he said weakly—'one of those poky little streets, that all look alike, round the church; Melbourne Street, number four. He does not pass for Crawley there. They call him'— It took stimulants, it took time before Nat Lee, brought very low now, was able to whisper the words—'Richardson is the name he goes by. A rare trick to play to old Judas!'

His deposition, or the substance of it, had been written down with patient care; and now it was read over to him, and, with much trouble, he was enabled, with feeble fingers, to affix a shaky signature to the paper, and to make formal affirmation of the truth of its contents. That exertion over, he sank back exhausted, muttering, and stirring from side to side, and then fell into a heavy slumber.

'He will never awake,' whispered the house-surgeon.

'If he does,' said Bertram gently, 'I will take care of him; and if he dies, at my cost shall the poor wretch be laid among his kindred at Dulchester.'

#### THE INSECTARIUM AT THE ZOOLOGICAL GARDENS.

It has long been a matter for regret that in the large and varied zoological collection which finds a home in the far-famed Gardens in Regent's Park, the insect world should have hitherto not met with the consideration it undoubtedly deserves. A few moments' reflection will remind us that the well-being of man is both ministered to and impeded by friends and foes to be found in the humble ranks of insect life. As instances it will suffice to mention the silkworm, 'that spins a queen's most costly robe,' and the industrious bee, which supplies us with honey and wax. As enemies to man may be named the mosquito and centipede, and the destructive caterpillars of many of our moths and butterflies.

The Zoological Society have, however, taken a preliminary step towards the wider diffusion of

knowledge respecting insects by the establishment of what is termed an 'Insectarium,' wherein are shown various species of insects, both living and preserved specimens in their different stages of existence, and, to the small extent that present circumstances allow, under natural conditions. Thus, one is now able to trace an insect such as a moth through its transformation-stages of egg, larva or caterpillar, pupa or chrysalis, and imago or perfect insect.

The building which has been set apart for the purpose is situated at the north side of the Gardens, near the foot of Primrose Hill, and is a simple hot-house, somewhat less than fifty feet long and about half the width. In the centre and at the ends of the house are placed some bananas and tree-ferns; and by means of heating apparatus a temperature of from seventy to seventy-five degrees Fahrenheit is maintained. The insects are kept in cases of wood and zinc, with glass sides and perforated zinc tops, the average size of these receptacles being about two and a half feet in height, one foot and a half wide, and one foot deep. The bottom of each cage is filled with moss and sand, thus allowing the pupæ or chrysalides of such species as enter the ground to undergo their natural transformations. In some cases the caterpillars—or larvae, as they are scientifically termed—are to be seen feeding, the food-plants being kept in small phials or tubes of water, or sometimes placed in the moist sand. The collection at present is but a small one; but the specimens are well chosen, including representatives of many of the most interesting and beautiful species from different parts of the globe.

Immediately on entering the glass-house, the visitor finds to the right and left of him cases appropriated to the various descriptions of silk-producing moths. Here, for instance, is the magnificent Atlas Moth, of a rich chocolate hue, with paler markings, and silvery transparent spots. This species, we are informed by the descriptive label, is an inhabitant of India, and one of the largest moths known, some specimens measuring as much as eight inches from tip to tip of the fore-wings. Some of its cocoons, in which the insects wrap themselves while becoming chrysalides, are likewise to be seen, manufactured of silk and dead leaves. Near this is the Ailanthus Moth, from China, a specimen of which has just emerged from the chrysalis, and is of a tawny colour, with delicate pink and silvery markings and beautiful eye-like spots. In another case are feeding a number of larvae of the Cecropian Silk Moth. The colours of the caterpillars are most brilliant, the ground tint being a bright green, with little fleshy tufts of red, blue, and yellow, each surmounted by six black hairs. There are many other species of silk moths exhibited, of which may be mentioned the Japanese Oak Silk Moth, whose bright green caterpillars are to be seen eagerly devouring oak-leaves; and Perny's Silk Moth, the larvae of which are similarly engaged. The chrysalides and cocoons of most of these species, together with samples of the raw silk they produce, are shown in the cases side by side with the perfect insects. We miss, however, our old and more sombre-tinted friend, the Common Silkworm Moth (*Bombyx mori*), who certainly deserves a place in the series, as the silk he produces is superior in many

respects to that furnished by his larger and more handsome relatives. The pale-green Moon Moths, from India and North America, of which specimens are shown in cases to the left of the entrance, deserve mention for the loveliness and delicacy of their tints. These, however, soon fade, as may be seen by comparing the newly emerged insect with the preserved specimens above it.

In one of the cases is to be seen a common foe of moths and butterflies, in the shape of the Ichneumon Fly, the female of which is furnished with a curious apparatus for depositing her eggs beneath the skin of certain caterpillars; these eggs quickly hatch, and the resulting larvae, carefully avoiding the vital parts, feed upon the body of their host. The larva thus preyed upon is frequently able to change to the chrysalis state, but from this it never emerges as a perfect insect, the ichneumon grubs finally making a meal of all but its skin, within which they in turn become pupæ, and at length appear as ill-favoured-looking flies. These parasites are of great service in checking the too rapid multiplication of destructive kinds of insects, the caterpillars selected for their attacks being usually the brightly coloured and smooth-skinned sorts.

Perhaps the most lovely specimens in the Insectarium are the Morpho Butterflies, shown in a glass case on the centre table. They are large insects, measuring about four or five inches across the wings, which are of an exquisite blue satin appearance, with pearly bands of white. Three different species are exhibited, all being inhabitants of South America.

Although our British insects cannot vie with the gorgeous colouring of their tropical congeners, they are nevertheless many of them of great beauty. Here, for instance, in a cage much too small for a winged being of air, are some freshly disclosed examples of the Swallowtail Butterfly, the largest British species, found principally in the fens of Cambridgeshire. They are noble insects on the wing, and have great powers of flight. But the most graceful of our English butterflies in its aerial evolutions is the White Admiral, of which, as we write, a living specimen is to be seen in a neighbouring case. This species is chiefly met with in the New Forest; it seems to float gently but rapidly through the air, every now and then settling high up on the trees, or descending to the bramble bushes, for which it has a great partiality. The caterpillar feeds on the honeysuckle, and the perfect insect, though not rare in its own particular haunts, is greatly prized by entomologists. The colours of the upper wings are simply black and white, beautifully diversified; while beneath there are delicate pencillings of light brown and silvery blue. Close to the White Admirals are specimens of the handsome Purple Emperor Butterfly, a still greater prize, and an insect with similar silvan propensities. It frequents the tops of oak-trees, but can be tempted to descend from this exalted position by a bait of decaying animal matter, such as a dead dog or rat. Here are some specimens of the different sorts of Tiger Moths in their various stages, and among them our old black hairy friends the 'woolly bears,' or in scientific parlance the larvae of *Chelonia carya*, the Garden Tiger Moth. These caterpillars are very abundant upon white nettles, docks, and other low-

growing plants, and the resulting moths are among the most handsome of our native species.

A closely allied species to the Tiger Moths is the pretty Gold-tailed Moth, whose wings are pure white, with a tuft of yellow hair at the end of the creature's body, which gives it its name. The caterpillars, of which living specimens are shown feeding, are black and hairy, with bright scarlet markings, rendering them very conspicuous objects upon the white-thorn and wild-rose bushes in our hedgerows during the early summer. The reader must be cautioned, however, should he meet with these caterpillars in his rambles, against handling them, if his skin be at all tender; for they possess what are called 'artistic' properties, causing great irritation of the skin in some persons, accompanied even with a swelling of the parts affected, which is by no means easily got rid of. In his excellent little book on *The Common Objects of the Country*, the Rev. J. G. Wood relates his experience with the Gold-tailed larva, which appears to have been particularly painful and unpleasant. The insect is a common one, and frequents the neighbourhood of London.

Whilst writing of London, we may mention two moths, also included in the collection under review, which are abundant even in the heart of the Metropolis itself. The first is the Brindled Beauty, a somewhat dingy brown insect, with semi-transparent wings, which inhabits most of the London squares, and can be found on the trunks of the trees in the month of April. The caterpillar of this species is very destructive to the lilacs and limes, and is of a dark-brown, stick-like appearance, and belongs to the family of Geometres or 'loopers,' so called from their peculiar mode of progression. The second moth alluded to is the Vapourer, of a rich chestnut-brown colour, with a white spot on each fore-wing. It may be seen flying in the streets and squares, in its own peculiar and characteristic manner, all through the summer, during the hottest part of the day. Curiously enough, however, the female is wingless, and more resembles a spider than a moth. The larva of this species, like that of the Brindled Beauty, is a great pest on account of its partiality for young foliage.

We must not omit to notice the caterpillar of the Goat Moth (*U. sec. ligaeformis*), whose evil odour proclaims its proximity to us. This is one of the 'zylophagous' or wood-eating larvae, so destructive—as the name *lymipeda* implies—to our forest trees, especially oak, willow, and poplar, within whose trunks it feeds for a term of three years. The jaws of this caterpillar are very powerful, and it has been known to eat through a piece of sheet-lead. It is a repulsive-looking creature, reddish-brown above, and flesh-coloured beneath; and we cannot envy the ancient Roman epicures with whom it is generally believed this larva was a favourite dish.

An interesting feature in the Insectarium is the exhibition of several examples of what is called 'protective mimicry'; that is, the power possessed by many species of assimilating themselves, either in form or colour, or both, to their surroundings, in such a manner as to enable them to elude the vigilance of enemies. Let us select one or two typical instances. In one of the cases are living specimens of the Lappet Moth (*Bombix quercifolia*), which has a peculiar method of folding its

wings. These are of a brown hue, with various markings, and when at rest upon dead leaves, the shape and colour of the insect render it scarcely distinguishable from the leaves, except to a practised eye. The specific name *quercifolia* may possibly have been bestowed in allusion to this peculiarity.

A noteworthy instance of the protection secured to caterpillars by their similarity to their food-plants, is afforded in the case of the larvæ of the Emperor Moth, a species closely allied to the silk-producing moths mentioned at the beginning of this paper. These larvæ are of a bright green colour, with raised pink dots, surrounded by black rings, a colouring which would naturally be considered most conspicuous; and if we are to judge from the caterpillars in the collection feeding on plum-leaves, it is difficult to understand how the food-plant can possibly guard them from observation. Their natural food, however, is the heather, and its prevailing colours being pink and green, the Emperor caterpillars of similar tints may easily be overlooked.

This subject of mimetic analogy is an exceedingly interesting phase of insect life, and one which has engaged the attention of many eminent naturalists, notably Mr A. G. Wallace, to whose published writings the reader is referred for further information on the matter.

One of the glass cases on the centre table appears to contain nothing but sand, within which are to be seen funnel-shaped depressions; but beneath these lie concealed the larvæ of that curious insect the Ant Lion. Every now and then, these cunning creatures cast up a quantity of sand, the object of which is to overwhelm the ants, and so cause them to fall down one of the holes, when they become an easy prey. A marvel of skillful industry is the 'Trap-door Spider's nest, composed of earth and silk in alternate layers, of which there are sometimes as many as forty. There is a hinged lid to the nest, which fits tightly, even requiring some little force to open; and the colour of his tenement secures to the spider immunity from observation, whilst he can open the door to obtain his prey, and close it on the approach of enemies.

Before bidding adieu to the Insectarium, of whose varied contents we have afforded but an outline sketch, we must not forget to mention the aquatic insects exhibited in their native element, among which the handsome yet voracious *Dytiscus* beetle, and his more sombre and harmless brother the *Hydrous piceus*, deserve notice, as also the larvæ of the Dragon-fly, and the curious Caddis cases with their worm-like tenants.

From the foregoing remarks it will be evident that the collection of insects at the Zoological Gardens is one of no common interest; and though at present it can only be regarded as the nucleus of a larger and more comprehensive undertaking, it has already met with a favourable reception, and well deserves a visit from all who are interested in natural history.

It is to be hoped that the eminent Society under whose auspices the Insectarium has been formed, will see their way to make it of use to the farmer and horticulturist, by bringing together the various insect foes with which they have to contend, and by exemplifying the methods which have been found efficacious in preventing the

attacks of insects upon our forest and fruit trees, and garden plants, &c. Such collections have already been successfully established in a few places, among which may be specially named those of the Free Library and Museum at Exeter, and the Exhibition of Economic Entomology at Bethnal Green; but the facilities at the disposal of the Zoological Society will doubtless enable them, should they make the attempt, to effect such an addition to their already famous collection, as shall render it one of paramount excellence and utility.

## CAPTAIN DESMOND'S DAUGHTER.

### IN FOUR CHAPTERS.—CHAPTER II.

DINNER was over, to which, notwithstanding the loss of her appetite, Mrs. Desmond contrived to do tolerable justice; and Margaret and her step-mother were seated in the drawing-room. The saffrons and yellows of an April sunset still lingered in the west; but the lamp had been lighted, and in the grate a log cracked and blazed, for the spring evenings had still a touch of winter in them. Mrs. Desmond sat in a low chair, with her fan in her hand, sometimes shading her face from the light of the lamp, sometimes from the blaze of the burning log. She would sit for hours at a time with her fan in her hand, doing absolutely nothing.

Margaret had been writing two or three notes; but the last envelope was directed, and she now sat with the pen between her fingers, wondering how the evening was to be got through, and longing for the hour to come when she could go to her own room and be alone.

'I suppose you wondered what in the world brought your father and me to this out-of-the-world place?' queried Mrs. Desmond presently.

'No; I don't think I wondered,' said Margaret. 'I presumed that my father had some good and sufficient reason for coming here.'

'The state of my health was the main reason. I had lost my appetite; I had become low and languid. The doctors said I wanted bracing, and that somewhere on the east coast would suit me best. Marmaduke saw an advertisement respecting this place in *The Times*, and at once made inquiries about it. The owner was ordered to a warm climate for his health—just the reverse of my case—and wanted to leave his house for the next five or six months in charge of some one whom he could trust to take proper care of it. Of course, in a neighbourhood like this, with no scenery, no society, and no large town within a distance of twenty miles, Mr. Earle could not expect to let his house in the ordinary way. He was content to secure a trustworthy tenant who would see that his property did not deteriorate during his absence. That tenant he found in my poor Marmaduke.' Mrs. Desmond paused for a moment to use her vinaigrette; then she resumed: 'We have been here just six weeks—or rather, I have. Your father was away on business a great deal, and I found it rather lonely at first; but I was gradually getting to like the place. Such a contrast, you know, from Brighton or Scarborough. Then again, my poor Marmaduke had been very much harassed of late; many of his speculations had turned out unfortunately; and people were importuning him

for money on every side. All he needed was time to recover himself. Meanwhile, it was a great relief to him to be able, whenever he chose, to come down to Mardon for a few days of perfect quiet. No importunate creditor ever dreamed of looking for him here; in fact, his address was a secret.

It never entered Margaret's mind to inquire as to the nature of the speculations in which her father was said to have been so unfortunate. Perhaps she had not forgotten the kind of speculations to which he had been addicted when she was a child and her mother was still alive—speculations which always seemed to have some connection either with horses or cards. But to whatever class Captain Desmond's commercial ventures of a later date may have pertained, his widow did not seem to think it needful to allude to them further.

'Did my father never complain of being ill?' asked Margaret. 'Had you no idea that his health was failing?'

'Of late, as I have said, he had been somewhat harassed in his mind; but his bodily health had never seemed better than during the last six months. He came home last Monday evening, rather unexpectedly, after an absence of five days. He was in excellent spirits, having had what he termed "a slice of luck." He was as buoyant and full of nonsense as a boy of twenty, and would insist upon having champagne at table—you know, dear, that he always had a little weakness for champagne—although I wanted him to be content with Saunterne. Well, dinner was over, and he had just poured out the last glass of wine, when all at once he complained of feeling faint. Looking across at him, I saw a sudden change in his face, that frightened me. I was by his side in a moment. My arms were round him, and he let his head rest on my shoulder. He tried to speak; but I could not tell what he said. Then his eyes closed, and he seemed to know nothing more. I screamed for help; and Elspeth and the girl came running in. We lifted him, and laid him on the sofa—he knew nothing of it, poor darling!—and then the girl ran off for the doctor. Fortunately, he was at home—there is not another medical man within half-a-dozen miles—and he came at once. His grave face when he saw your father only served to confirm my own fears. Everything was done that his skill could suggest; but to no avail. My darling husband never opened his eyes—never spoke again. But so peaceful and quiet was his end, that we scarcely knew the moment when he left us.' Mrs Desmond pressed her perfumed handkerchief to her eyes as she finished her narrative. Margaret turned away her head, and let her tears flow in silence.

Presently, Elspeth came in, and closed the shutters and lighted another lamp.

'An invaluable creature that,' remarked Mrs Desmond as the serving-woman left the room. 'I should have been lost without her at a time like this.'

'Has she been with you long?' asked Margaret.

'She came with us when we came to this place. She was out of a situation at the time, and having known her several years previously, I at once engaged her. She has the highest of recommendations from her previous employers.'

Again Margaret's conscience pricked her. Because there was something in Elspeth's looks

that she did not like, she had felt her dislike extend to the woman herself. What childish, unreasonable prejudices were these!

'Do you think of remaining at Larch Cottage for the remainder of your term?' asked Miss Desmond by-and-by.

'Good gracious, no, my dear! I could not bear to stay in the place after what has happened here. So lonely, too! I shall get away from it as quickly as possible. I have several friends here and there, and shall spend two or three months among them, while my affairs are being settled. Ultimately, I shall probably go abroad, and reside there *en passant*. The English climate is too trying for me; and I have a brother settled in France, as no doubt you are aware.'

Margaret had not been aware of anything of the kind; but there was nothing in that. Mrs Desmond was not in the habit of talking about either her relatives or her antecedents, and might have half-a-dozen brothers, for anything Margaret knew to the contrary.

The ladies separated early. Miss Desmond was tired with her journey, and was glad to be alone. She had many things to think about. Sleep was long in visiting her eyes; but it came at length. In a half-dreaming state she heard, or fancied that she heard, a clock in some other part of the house begin to strike the hour. 'Surely that must be midnight,' she said to herself; and she began to count the strokes; but before the clock had ceased to strike, she was fast asleep, and knew nothing more. How long she had slept, she did not know; but she awoke suddenly from a dream about her father. It was still quite dark, and for a moment or two she could not call to mind where she was. Then, as with a flash, everything came back to her. Wide awake she lay, feeling that sleep had fled far from her, and longing for the first gleam of daylight. She would rise and dress, and go out before any one else in the house was astir. She would go down to the room where her father lay in his coffin, and kneel for a little while by his side. Then she would quit the house, and find her way to the shore, and wander about alone, drinking in the solitary beauty of the morning. Meanwhile, darkness and silence brooded everywhere.

All at once she heard a sound—the sound of a footfall in the room immediately over her own. Could it be Elspeth or the girl who was stirring thus early? Then she remembered how Mrs Desmond had told her that the whole of the rooms on the upper floor had been locked up, and the keys taken away by Mr Earle. This thought was still in her mind, when she heard the footsteps again clearly and unmistakably. Of a surety, there was some one in the room over her own. Whoever that some one might be, he or she walked slowly across the room, and then paused for a few moments, as it might be to peer out of the window, and then walked slowly back again. There was no other sound anywhere.

By this time, Margaret was sitting up in bed and listening, as she seemed never to have listened before. Her heart was beating quickly; vague horrors thrilled her nerves; there was upon her that dread of the unknown, which is far removed from ordinary fear. Suppose the footsteps should come down-stairs!—suppose they should pause at her door—suppose they should enter her room! She remembered, not without a little

thrill of terror, that there was no key in the lock of the door. Any one might come in who chose to do so.

But next moment she laughed at herself for her foolish fears. What a fuss to make, because she happened to hear some footsteps in the dark for which she could not account! Had she heard them by daylight, she should have thought nothing of them. And yet the question would recur: Whose footsteps could they be? She heard them again and again—three or four times in all—at intervals of a few minutes. After that, she heard them no more, although she lay listening upwards of an hour. By-and-by she fell asleep again, and did not awake till broad daylight.

As she lay listening in the dark, she had determined to make mention of the footsteps to Mrs Desmond, and ask her for a solution of the mystery. But, as it happened, Mrs Desmond breakfasted in her own room that morning, and Margaret saw nothing of her till later in the day, and then she had other and more serious matters to occupy her thoughts.

Margaret went out in the course of the morning, and found her way to the little church on the hill where her father's grave was already dug; and as she made her way slowly back through the lanes, she gathered a few will-flowers to strew on her father's coffin.

On Saturday, the funeral took place. It had been Margaret's intention to start back for London the same evening; but she found there was no train by which she could do so, and that she must perforce stay where she was till Monday morning. Mrs Desmond was evidently pleased that she should do so.

As they sat together on their return from church on Sunday afternoon, Mrs Desmond said: 'I have no doubt, dear, that you naturally feel a little anxious to know the contents of your father's will.'

'My father's will!' exclaimed Margaret. 'I did not know that there was any such document in existence.'

'Did you not know that your father had insured his life for a very considerable amount, immediately after his marriage with me?'

'No. This is the first time I have heard of such a thing.'

'You surprise me. Such, however, is the fact. Captain Desmond said he did not choose that in case of his death I should be left without resources. The insurance he effected was for ten thousand pounds, divided among various offices. It was so noble and good of him,' Mrs Desmond paused for a moment to press her handkerchief to her eyes. 'As it happened, I had a small annuity left me by my first husband,' resumed Mrs Desmond. 'This annuity was just sufficient in amount to cover the premium on the insurance, and was to be set aside for that purpose. The will is in the hands of Mr Benson, a solicitor, and an old friend of your father. I shall have to administer it; but I suppose some months will have to elapse before the insurance people finally settle with me. I shall find it a tiresome affair, I do not doubt.'

Again there was a pause, which Margaret had no inclination to break. Mrs Desmond looked at her, and thought she had never seen a young person so devoid of natural or even laudable curiosity. 'You

will find that your father has not forgotten you in his will,' resumed the elder lady.

Margaret started. 'Not forgotten me! I do not understand you,' she said.

'And yet my words are plain enough. Captain Desmond by his will bequeaths to you, his only child, a legacy of one thousand pounds.'

Margaret was astounded, and knew not what to say.

'Beyond the legacy in question, everything is left to me,' pursued Mrs Desmond, with an air of pious resignation. 'I must seek out some safe investment. I ought to be able to get five per cent. interest for my money, at the very least.'

The Sunday evening passed. Margaret bade Mrs Desmond good-night, and retired to her room, and that Monday morning was so close at hand. There would be time for one last visit to the churchyard after breakfast. The train by which she intended to travel started at eleven o'clock. Before getting into bed she left a night-light burning on the chimney-piece. She had found a box of lights in her room, the morning after she heard the footsteps, and, actuated she hardly knew by what feeling, she had burnt one each night since. Although she had lain awake for a long time each night, she had not heard the foot-steps again. She was wakeful and restless; but after a time she fell asleep. She had been asleep for some hours, when she suddenly opened her eyes, impressed with the strange sensation which sometimes makes itself felt even in profound slumber, that some one was looking intently at her. She opened her eyes, and saw that another pair of eyes were gazing fixedly at her no great distance away. She had scarcely time to wonder why this should be so, before she recognised, with a thrill of unpeakable joy, which changed an instant later into one of immeasurable awe, not unmingled with horror, that he who was looking so earnestly at her was none other than her father!

The light that burned in the room was dim; but it was impossible that she should mistake the features of that well-loved face for those of any one else. His body was partly hidden by the curtains at the head of the bed, and at the moment she opened her eyes he was leaning over towards her, as if to see her more clearly. A low cry broke from her lips, and she started up in bed. As she did so, her father's figure vanished behind the curtains. She rubbed her eyes, and looked again; but he was certainly no longer there. Bewildered, awe-struck, and still feeling only half-awake, she slipped out of bed, and putting forth a timid hand, drew the curtains aside, as though half-expecting, half-dreading to find him hidden behind them. But no one was there.

Then she went to the door, which was on the same side of the room as the bed, and opened it. She was under the impression that she had shut it, on entering her room for the night; but that was a point on which she could not be quite positive, and in any case, it was not shut now. There was nothing to prevent any one from entering her room when she was asleep. She now opened the door wide, and ventured out a few steps into the corridor. It was a clear night, and the stars shone brightly through the window at the opposite end. She could see the entire length of the passage, and make out the positions of the

different doors that opened into it. There was certainly no one there but herself.

The door of Mrs Desmond's room was exactly opposite her own. This door Margaret now ventured to try with her hand. It yielded to her touch and opened. She advanced a step or two and looked into the room. All was dark within, far darker than in the corridor, curtains being drawn across the windows. The only sound that broke the intense silence was Mrs Desmond's low quiet breathing as she slept.

Margaret withdrew as softly as she had entered, and went back to her own room and shut the door. She had still the same awe-struck feeling at her heart, she was still as utterly bewildered as at first. She lighted her candle at the little night-light, and drew a thick shawl round her shoulders, and sat down to think. That she had in very truth seen her father, she should never doubt, to the last day of her life. She had heard and read of cases where, for some mysterious purpose, the dead had been allowed for a few brief moments to revisit the living. Could this be such a case? Could her father's intense longing to see her have been powerful enough to enable him to carry out his wish? Or had she, after all, only been the victim of a by no means uncommon form of hallucination? She was very loath to believe the latter. But it was all a mystery, and one which, in all probability, she would never be enabled to unravel, as long as she lived.

# LIFE IN CANADA.

BY ONE WHO HAS BEEN MORE THAN TWENTY YEARS A RESIDENT THERE.

THOUGH we have already upon more than one occasion offered hints to intending emigrants, the importance of the subject and the interest it seems to evoke, encourage us in publishing the following supplementary observations from a Canadian resident.

Some years ago, says our correspondent, it was my privilege to contribute a few pages to one of the leading periodicals on the subject of Canada and the emigrant's prospects there; and now, after more than twenty years' residence, a further narrative of my experiences, especially of the rural and out-of-the-way districts, may prove interesting to some who think of emigrating, or who have friends here.

During the past twenty years, manifold and portentous changes have taken place in this country. Tracts of it almost unknown before, are now intersected by railways, conveniently connected together, and dotted over with thriving villages; while smiling homesteads and well-cultivated farms replace the dense bush and swamps that formerly prevailed. Those acquainted only with the old-world cities and towns, have little idea of the gourd-like rapidity with which villages spring up in this country. Simple board or lath-and-plaster houses of from five to six rooms, can be built and rendered habitable within a week. The former are sometimes occupied before the walls are plastered inside. A tavern is generally the nucleus of a village. Then come a general store and post-office, followed by the inevitable black-

smith's and shoemaker's shops; and the village is established. In a year or two afterwards, there will most likely be several streets. The houses, isolated at first, gradually approximate towards each other. Brick takes the place of stone as the buildings increase; and the first small tenements are moved away on rollers to some back street, where they suit the means and convenience of the less wealthy inhabitants.

Among the first buildings of any size are churches of Protestant denominations—for Canadians are pre-eminently a church-going people. Thus it follows that, as every year brings out its thousands of immigrants, almost all of them in the prime of life, they push on to cheap lands, which still lie unclaimed; make a purchase of fifty or a hundred acres, pay a small sum down, and obtaining a long day in which to pay up the balance, settle themselves in the primeval forest. Some are fortunate enough to get the shelter of a fellow-settler's shanty, generally an edifice of most primitive structure, about sixteen feet by twelve, put up in a few hours. It is built of rough logs, notched at the corners, so as to fit into each other firmly; the roof being of bark or slabs. The openings between the logs are filled up with mortar or moss, and one window and door suffice. In such a dwelling, some dozen or more people will sleep comfortably and healthily, while perhaps the snow still lingers in the late spring, and drifts through the chinks of their rustic shanty. Of both air and heat they have abundance, for the great cooking-stoves of modern days have quite superseded the wide fire-places of old times. The latter are now seldom seen; while the former sending forth an equable and all-pervading heat, are greatly preferable to the hearth and its cold wide chimney.

Those immigrants who are not so favoured as to have such friendly shelter, try to avoid taking their families into the bush while snow continues to fall, as it sometimes does until April. At times, a large family 'go in,' and camp out; some in the wagon, some under it, thus managing till the shanty or house be ready. Should the weather prove favourable—and we have no long-continued rain here—they will generally have enough of ground cleared to give them plenty of potatoes for the first year, and perhaps some grain. Thus a farm is commenced which may in the course of ten years have a good house and barns on it, a bearing or hard, and good fences all round and through it.

Now, in the foregoing I have just given a slight sketch of what has been going on in newly opened sections of this country since I first came to it. But this old state of things as regards hardship and difficulty has in these days of numerous railways and other convenient means of travelling, all but passed away. In fact, the almost overpowering difficulties and obstacles which used to beset the settler's path twenty or thirty years ago, have been greatly meliorated. Many of the conveniences of modern life, formerly not to be had here, or at best confined to a favoured few, are now within the easy grasp of all. Added to which is the fact, that money is more plentiful, because of the general prosperity of the country.

It is usual with immigrants to choose locations that are most easy of access; hence the best lots are seized upon first; yet, says the *Atlas of Ontario*,

'vast tracts of uncleared land are still in the hands of the government of Ontario, awaiting the advent of the settler. There are large quantities of wild land inviting the labour of the backwoodsman, which, when cleared and improved, will be equal to not a few of the older and improved settlements. There are in the province of Ontario the following number of acres: In total area, 77,606,400; total surveyed, 25,297,480; total granted and sold, 21,879,048. These are the figures of some two or three years since; but allowing for the work of these years, there are still some three million and a half acres of surveyed government lands not yet taken up, and more than fifty millions of acres not yet surveyed. The free-grant lands in Ontario are worthy the attention alike of the immigrant, and of parties already resident in the country who are desirous of possessing freehold farms, but whose means are limited. The provincial government have thrown open, upon the most liberal terms, a number of townships, into any of which parties may go and select for themselves the site of a future home. Thus over three million acres are before them; and every head of a family can obtain, *gratis*, two hundred acres of land; and any person arrived at the age of eighteen may obtain one hundred acres in the free-grant districts. This offer is made by the government to all persons without distinction of sex; so that a large family having several members of it at or past eighteen years of age, may take up a large tract, and become in a few years, when the land is cleared and improved, joint possessors of a valuable estate. The settlement duties are: to have fifteen acres, on each grant of one hundred acres, cleared and under crop, of which at least two acres are to be cleared and cultivated annually for five years; to build a habitable house, at least sixteen by twenty feet in size; and to reside on the land at least six months in each year. In the older settled townships, farmers possessing moderate means can readily purchase or lease suitable farms of from one to two hundred acres, more or less cleared and improved.'

I know of one farmer who, some ten or twelve years ago, got a free grant of a thousand-acre island among the lovely lakes of Muskoka. He had a large family of sons and daughters; and now the same island is divided among them in fine farms, and they have made their own roads, &c., in it.

The generality of people in the old country have no idea of the vast extent of Canada. Ontario, for instance, is larger than the United Kingdom. Yet it is only a small part of the Dominion of Canada, which is nearly as large as Europe. When I first came here, I hated the country, and pined for home, as I still call it. I love my native land, and think there is nowhere in this wide world to compare with it as a place of residence, if one could only afford to live there. I brought my family to this country when, in point of years, they were all helpless; and we had to contend with many disadvantages, and with very heavy trials and bereavements; yet it has pleased Providence to bring us out of them all. As to whether I or my family should all have been so well provided for, had we remained in the mother-country, one cannot tell; but speaking as I know, I think we should not.

The principal objection I have ever had to this country is the severe winter. It is now the beginning of April, and snow well frozen lies round in piles. The sun is warm and bright, but the frost-king still reigns. Cold is never felt within doors, because of the stoves and other appliances for comfort. The summers are delightful, and they last about six months. The other six are not much else than winter, so far as cold goes.

Since I left my native land, I have visited it some two or three times; and on each occasion was most unwillingly convinced, that for those whose means of subsistence are precarious in the old country, Canada is in most cases the better place. It is a land of peace and plenty. In rural districts, the people may leave out their stock night after night without fear of their being taken or injured. They can also omit barring and bolting doors during the night, and can travel about at all hours without heed of six-shooters or loaded sticks. If they fail to succeed in one thing, they can take up another, not being fettered by laws and customs of class.

I also noticed another item when at home, namely, that Canadians are far ahead of the mother-country in possessing handy, easily managed farming implements. Consequently, they can cultivate large farms with fewer hands and fewer horses than is the custom in the United Kingdom. Very few farmers here are without reaping and mowing machines, seedling-machines, cultivators, &c. Labourers, or, as they style them, 'hired men,' are well paid. No one need be idle who is willing and able to work; and if they have assiduity and good character, they will do well. Though only a few may rise to opulence, all may be independent.

I know one kindly honest fellow who borrowed his passage-money to come here. He engaged with a wealthy farmer at eight dollars per month, with board and lodging, for the first six months. So well did he fulfil his duties, that at the end of three years he had twenty dollars per month with board. Meantime, he sent home money enough to bring out his father and four other members of his family. All these at once obtained employment in farmers' houses; some of them also learned to read and write with their employers' children; and they are all independent now, while their elder brother and forerunner has a good farm of his own, well stocked. All this took place in the course of ten years.

A large proportion of our doctors, lawyers, and clergymen are the sons of farmers - I mean *working* farmers - for the public schools here are on such a basis and principle, that any young men who wish can fit themselves for entering college. The fine libraries, such as the Mechanics' Institute, where works by the best authors can be had for a trifling subscription, are most advantageous in raising the moral and mental standard; and when a town can claim some two thousand inhabitants, the government, on application, will give a yearly grant, paid annually towards the library. Daily and weekly papers of all kinds are also very cheap and numerous. The natural consequence of all this is, that the people are generally more intelligent and better informed than the same class would be in the mother-country; and that conscious of their own power and their many re-

sources, they are thoroughly self-reliant and independent.

Some writers are prone to represent even the well-settled districts as far behind in civilisation. I cannot say so, and I wish to give a truthful account. Where I now reside, there is a smart village, containing churches of nearly all denominations, with some fine hotels and private residences. In the smooth lawns of these residences, during summer evenings, the click of the croquet mallet and the gaiety of the lawn-tennis players may be heard. When I take a drive into the country, I meet well-dressed men and women in comfortable vehicles; and if I pay a visit at any of their houses, I find modern furniture, pianos, organs, &c. Yet this district, twelve or fifteen years ago, was almost a mass of solid bush.

Riding on horseback is a favourite amusement, and as a general rule, the people here are well mounted in every way; and though the girls do not ride to the meet, as in England, yet I have seen some well mounted and equipped, from saddle to elegant silver-tipped riding-whip, riding alone on the quiet roads.

Wolves and bears always retire to uninhabited districts. The echo of the chopper's axe is not agreeable to their ears. I could never find any one who was molested by these animals, except those who came to this country thirty or forty years ago. If I be not mistaken, five dollars per head are allowed by government for these marauders; so that for this reason, if for no other, their numbers must decrease.

The Colorado beetle, or potato-bug, is troublesome and destructive; but since the use of Paris Green has become general, they are not much dreaded. A small proportion of this poison sprinkled on the plants when the insects first appear, will kill the first crop of them; and a second application in the course of some weeks, will almost exterminate them; all that remain will do no harm in one season. They burrow in the earth, and reappear to lay their eggs next summer. At first, people used to pick them off the plants; but that is seldom done now. The midge used to be fatal to the wheat; but since the introduction of what is called the midge-proof wheat, that scourge has almost disappeared.

As to the price of land, the advertisements show that improved farms, with house, barns, &c., can be had in good districts at from fifty to eighty dollars per acre, according to locality. For instance, near a city the prices would be higher. Outside this village—which is about seventy miles north of Toronto—two hundred acres of uncleared land, covered with beech and maple, without house or fences, were sold for thirty-five dollars per acre—about seven pounds sterling.

And now about the Indians. I remember my own ideas on the subject, culled from hearsay, or from the writings of various authors. I imagined them as painted, beaded, and befathered; and in this as well as other things respecting them, I soon found my mistake. Two or three years ago, a number of them encamped within half a mile of my residence. They travel about from place to place, and pitch their tents where there are plenty of elm-trees, of which they make all kinds of baskets, from the flat butcher's basket to the large round basket that holds a bushel; besides all kinds of ornamental satchels and

articles suitable for carrying in the hand. Winter is the time they choose for this employment, generally coming to the camping-place in October, and remaining till March or April.

I went into the bush to see them. It was a sheltered spot, a short distance from the road. Snow covered the ground; and the blue smoke curled from the tops of their tents through the tall trees overhead. Very pretty and romantic, some of my readers will say. Well, yes; in a painting; but not at all so when seen in reality. There were about a dozen tents. The first day I went to see them was Sunday, and the tents were closed up. They pitch these generally by chopping down posts of about six feet high, with crutches on the top, to hold horizontal pieces or straight limbs of trees. This frame they cover with boards—if they can get them—quilts, or sheets, perhaps tacked out with an old garment or two; altogether a patched, shabby-looking arrangement. A large square opening is left in the peak of the roof, to let out the smoke, for they keep up large fires day and night in their tents. I went into two or three of them. In one which was about twelve feet square, I saw about eight or ten people of all ages, from the baby, which swung from the roof in a small birch-bark cradle or cot just its own size, to the hideous old crone who may have been its great-grandmother. A great wood-fire blazed in the centre, round the ashes of which crouched the children; one of them perfectly white, with red hair, supposed to have been kidnapped. Benches covered with soft pine branches and mats lined the sides of the tent. By night they served for beds, by day for seats. I was invited to sit down, but declined, as the Indians do not practically believe that cleanliness is next to godliness. They are naturally indolent, and in most cases will only work when impelled by hunger. They will never hire out and earn, or bind themselves to work like white men; and would not barter their freedom for money.

In another tent, I saw a comely woman, who had her small dwelling neat and clean. She spoke good English, and was tidy in her person. She belonged to their 'upper ten,' being the wife or daughter of one of their chiefs. I went to see them again on a week-day, and found them all at work, making baskets and mats. They split the wood of the elm while green into long pieces, then score it with *pronged* knives, and beat it out till it can be nicely divided into strips, to suit the manufacture of baskets.

The Indians whom I have seen are not by any means handsome or 'noble in bearing.' They are quite the reverse. They have no distinguishing garb, except a blanket, alias a common cloth shawl or rug, pinned on the square round their shoulders and heads. This is worn by the women winter and summer. The men sometimes use it, but not on their heads. The village people and farmers are generous to them, and they pick up plenty of old clothes. I have been sometimes amused to see young Indian girls in a new rig of bright calico made with an attempt at fashion. The men always wear shoes or moccasins; the women are seldom so well off. A very old squaw came to my door one day with baskets to sell, made by herself. From curiosity, I asked her inside. I could gather from her that a man was reckoned well off among them according to the

quantity he had to eat. She said: 'Oh, such a one is well off; he has plenty to eat; he can eat twice a day. Not many of us can do *that*. I seldom get more than one meal a day, and am very glad to get that.' Poor old creature! She must have been very tall and gaunt in her young days; but at the time I saw her, she was bent over on her staff.

While the Indians were in this neighbourhood, they must have made over a thousand baskets. I used to see large loads of them as they passed to the railway station. The government have provided lands for the Indians, called 'Indian Reserves.' There they are helped in various ways, and are encouraged to be industrious, also to send their children to the schools, where they are taught in their native language, as among themselves they speak no other. But many of them prefer a nomadic life; hence their occasional visits here. In my judgment, their life is a hard one, that is, as regards those of them who have no settled homes. They are half their time hungry, and must suffer greatly from cold, with such wretched tents and scant bed-covering.

A pleasing halo of romance hangs over Canada in the eyes of those at a distance. The grand primeval forests, the rarely-clouded skies, the deer, the wolves and bears, lend a glow of enchantment to the mind's vision. Then the idea of so much to be got for so little; the free life too, away from old-world cares and ceremonies; even the smallest shanty, in the midst of all this, with a peculiar radiance of its own. I remember having such romantic ideas about it myself; but like many another distant land of verdure, when I actually came to it, its beauty vanished. I stepped behind the magic veil, and found a land of stern realities, where people have to toil when the thermometer is at eighty degrees in the shade, and where they must do the same when it is far below zero.

Look at it as one may, there is no romance for those who must earn their bread by the sweat of their brow. It is all very well for those who come to the beautiful Muskoka lakes, or such-like, in summer to camp out and fish, with 'lots of cash' to spend, and who have charming homes in England, or elsewhere, to which they may return when they grow tired. To them, indeed, the halo never dims. But with those who are attracted by the glowing descriptions given by such happy people, or, as is sometimes the case, by parties who have lands to dispose of, it is a different matter. They often break up moderately comfortable homes in the United Kingdom to come to a strange land, where at first all is so different. Many such remain but a year, or a few months. Nay, I have known them to stay but a few days, when they went back homeless, though perhaps not friendless. I confess I would have done the same myself, if I could have done it with prudence. Therefore, let all *who are doing fairly well* in dear Old England, think twice before leaving it.

A merciful Providence has opened up this great country for such as there is no room for at home. There is room and to spare for them all here, and a welcome also; but let people beware of throwing up a means of livelihood and a quiet fireside at home, for a shanty out here.

My home in the old country was in one of its most beautiful localities. I think I see it now,

with the sunlight glinting on the purple heather of the mountains and upon the open sea beneath! In all my wanderings, I have never yet seen its equal in any way. No Canadian scenery, however vaunted, could compare with what I left behind. Yet Canada has been, so to speak, a good step-mother to me, if even I had some hard times with her in early days. And I say to all who are crowded out in the United Kingdom: 'Come out, and get under the wing of this same good step-mother. She may be rough and strange to you at first; but she will not *starve* you, unless it be your own fault. She will insist, however, on your being industrious and temperate. Late and early you must work, if you would win her favour; and if she find you obedient and good, she will provide for you out of her great abundance, and you shall have ease in your old age.'

### FISHERMEN'S GRIEVANCES.

CHRONIC grumblers, who would complain of nothing so much as the removal of a pet grievance, are everywhere to be found; and there are classes of men, such as the British farmer, who are, rightly or wrongly, accredited by tradition with a fancy for always keeping a grievance in stock. This is a charge that cannot, however, as a rule be brought against the salt-water fishermen, poor fellows, who, though not exempt from faults, and some of these not insignificant, are at the same time not given to fault-finding without some very special reason. The fishermen of the east coast of England have laid before government an array of grievances so formidable, that an International Conference has been called to consider them. At one period, it may be remembered, our friends entertained an unreasonable jealousy of the Scotch fishermen, who, as they had a perfect right to do, came into their waters, and, by their sensible method of fishing, and more careful style of living, seemed to do better than their English brethren. There was an unworthy feeling, of which the better class of fishermen were ashamed. Vastly different is the intolerable condition of things *now*, and which they have protested and appealed. The present is a real, not a fancy grievance.

The bountiful seas that inwrap the British Islands with their white-fringed garments have never withheld their finny harvest in due season; now, as ever, they supply lavish and wholesome food to the peoples of many lands. But the tens of thousands of hardy men who gain a livelihood by gathering in the harvest, minister to our needs through hard-labour and danger. For nine months in the year, in all weathers, their little craft toss and drift, or work with the trawl at heel, far from home. While landfolk slumber in ease and safety, they keep patient watch, now rewarded by splendid success, now toiling almost in vain. In the cold blasts of the Northern seas, the hardy fisherman remains for weeks together, fortunate if, by-and-by, the smack or dandy does not return to shore with one or more of its crew missing. The natural difficulties of the occupation are surely enough and to spare. There can be no need for added strife and passion; and to remove these grievances, and, if needs be, to protect these men against themselves, is a work which well

benefits the deliberations, as it indeed demands the prompt action of a conference amongst the representatives of such countries as England, France, Belgium, and Holland. Let us glance at the grievances which thus call aloud for remedy.

The herring and mackerel fishermen are first in their list of complaints. As many of our readers are aware, the small vessels engaged in this occupation use the drift-net, which may be roughly described as a continuous wall of net, averaging more than a mile and a half in length, and six feet in depth. The wall consists of a series of nets carefully fastened by long seizings to a warp at the lower edge, sunk below the surface, and kept in position afloat by bladders and corks. On the fishing-ground, sometimes thirty or forty miles from shore, the sails are reduced to a small mizzen, the mainmast is lowered upon a crutch, and the craft takes head to wind. The wall of net is paid out, until the boat remains fastened to it by the strong warp, as to a buoy. By this time, evening should be drawing near. During the night, vessel and nets drift whithersoever the tide listeth; and at daybreak, the shout of 'Haul-ho!' summons up the slumbering crew to drag in the net, and shake out the silvery shoals that have been caught in the meshes. This is the operation with herrings, and it is the main business of the fleet.

The allegation is, that foreign trawlers deliberately run across the nets, with the express purpose of destroying them; and the evidence given before a Royal Commission during the autumn and winter of 1880, reveals even a worse state of things than was at first supposed to exist. It is a serious charge to bring against the foreign fishermen; but the proof is unfortunately too clear. They have not even the plea of ignorance to advance. In the nature of things, it cannot be avoided that, in dark and stormy weather, the nets should occasionally be destroyed by accident. The writer of these lines once indulged in an expedition on board a Yarmouth herring-boat; and during one night, three brigs, a French smack, and a barque passed through the line of nets. But the fishing-ground selected was nearer shore than usual, and the damage done was trifling. It was one of the chances of the business always reckoned upon. Yet there are certain well-established rules known to all fishermen, and they are generally observed by the English and French, though criminally disregarded by Belgian and Dutch. The fishing-craft, according to these regulations, should carry two lights on the mizzen stay, not less than three feet apart, while the nets are out; while the ordinary red and green signals indicate that the course is clear. Add to this the regulation that *trawl-boats* shall not come within three miles of boats which have shot their nets, and a simple code is apparent.

Trawling, as most of our readers are doubtless aware, is a method of catching fish by means of a heavily weighted net that drags along the bottom of the sea. To overcome the resistance of so ponderous an affair, either steam-vessels or large sailing-craft are necessary; and for these, certain regulations have very properly been made, one of which we have just cited. It may be added that great jealousy usually exists between trawlers and other fishing-craft. Notwithstanding the foregoing rules, thousands of pounds

of damage are annually inflicted upon the herring-fishers by the wilful disregard of these provisions by foreign trawlers; so that in the morning, when the prospect of a fortunate haul lends energy to every man, it is discovered that the warp, which is the backbone of the frail structure of network, has been severed, that probably one half has been completely lost, and much of the rest spoiled. The discovery is hard to bear; but still harder is the certainty that it is the result of malice aforethought. The passage of an ordinary ship across the nets would tear the meshes, but leave the warp intact. The warp is cut, however, as clean as if done by a knife; and this is known to be the work of an infamous machine called 'the devil.'

This machine is a heavy four-fluked grapnel, with the upper part of each fluke purposely sharpened. It is sunk a fathom or so over the bows of the marauder, and has no other use than the destruction of nets. It so happened that while the Royal Commission of 1880 was sitting, a boat returned from the fishing-grounds off Lowestoft with a specimen accidentally left by a Belgian trawler in her nets. The chain by which it had been suspended had broken, and 'the devil' was taken in the very act of crime. It had cut away forty-five nets, damaged twenty-five others, and cut the warp; and its flukes were not unlike the curved blades of a large scythe. The build and rig of the trawler proclaimed her an Ostender; but the darkness and stormy sea prevented further recognition. She crept away, as she had approached, a thief in the night; and the Englishman had to come in to refit and write off a loss of twenty-five pounds. It is only fair to add with regard to this 'devil,' that twenty or thirty years ago it was known also to be in use by a few evil-minded English fishermen; but this was in the old time, when Barking was the centre of the trade.

The motives actuating the foreign fishermen are as black as the deed itself. Professional jealousy is probably one not inconsiderable motive-power. Theft is another. Meanness so contemptible would seem to be incredible, did not fact upon fact establish it. An Ostend trawler, three seasons ago, was detected seizing the nets of a Lowestoft boat, which sailed round him, and threatened to run into him unless he released the gear. Already the decks of the foreigner were piled up with stolen nets, and compelled at last to make sail, the dastardly crew tore the relinquished spoil to pieces. The lost nets are often traced to Ostend, where they are freely offered for sale, or kept, in the hope of extorting salvage from the rightful owners; but as the cost and vexation of establishing a claim in a foreign country would more than outweigh the value of the recovery, the thieves escape with impunity. The English fisherman thus loses his nets with the fish entangled in them, besides losing the time spent in repairing the remnants.

The Ostend fishermen, not content with habitual destruction of other men's goods, add insult to injury. How far the Englishmen take the law into their own hands, does not appear; and perhaps the story told by the other side would reveal something in the nature of reprisals. The indignities offered are often sufficient to justify the armed resistance which some of the English

fishermen hint at, if something is not speedily done to put an end to the nefarious practices which have been accumulating for years, and which were never worse than during the season of 1880. In the previous year, the master of a Suffolk smack observed an Ostend boat—identified afterwards as *Les Trois Amis*—trawling towards the nets; and at once manned a boat to warn the intruder off. When within forty feet of the trawler, the Englishmen were fired upon, and in apprehension of a second shot, were compelled to lie down in the bottom of the boat. *Les Trois Amis*, at her leisure, then sailed through the nets; came about, and tore through them again, cutting adrift eighty nets the first, and eighteen the second time. It is a common occurrence for the foreigners to salute a boat's crew, arriving from a smack to claim explanation and compensation, with the stones brought up by the trawler, with lumps of coal, and invariably with certain forms of derision and contumely, which are particularly hard for a Britisher to bear. Sometimes the foreigner appears to drive through the nets with the express object of laughing at the anger of the English crews. In December, a French crew pelted *The Star of the East* with coal and dog fish. Dutch fishermen have been known to hack an Englishman's nets to pieces with knives, in a spirit of sheer mischief.

These buccaneers of the North Sea display much cunning in escaping detection. They hide the name and number of the vessel, and for the time remove any other distinguishing feature; and as they, contrary to all maritime custom, habitually sail without lights, they are able to get away scot-free. Emboldened by the absence of any police of the sea, they flaunt the hated 'devil' in the eyes of any crew they may casually pass on the sea; and in a thousand ways defy and annoy them.

There yet remains a grievance, as to which the Englishmen are themselves partly to blame—namely, the Dutch *cooper*, bumboat or floating grog-shop, by which the men are demoralised and crime encouraged. It is a villainous traffic; and to their shame be it said, two or three Englishmen, scurvily sailing under foreign flags, are known to be engaged in it. The business is probably remunerative; but what shall it profit a man if he assist in producing 'gross breaches of trust, assaults, violence, robbery, obscenity, smuggling, and in not a few cases violent deaths?' That is the catalogue of results attributed by the Royal Commission to the presence of bumboats amongst the North Sea fishermen.

The Dutchman is the chief offender under this head. He is licensed by his government to sail the seas in a craft resembling the ordinary trawler, and to sell dutiable goods of various kinds, including, of course, spirits and tobacco. Under wholesome regulations, this accommodation might be welcome; but the abuse of the system is so terrible, that the majority of English fishermen clamour for its abolition as a public nuisance. So keenly do they feel upon the subject, that they prevailed upon the Royal Commissioner to take evidence upon it, albeit it was outside his instructions. And the list of horrors was truly appalling. The fishermen recognise the *cooper* by a basket hung from the stay as a sign. They go on board,

intending perhaps only to replenish their exhausted stock of tobacco; then they are tempted to drink; and the mischief is done, for the stuff is a treacherous and poisonous compound of white spirits and vitriol, which speedily produces a maddening effect.

Time would fail to tell of the actual deaths that have been directly traced to this stuff. Thomas Long bartered his fish for it, drank largely, returned to his boat, and died in three hours. A man named Sergent offered his clothes, drank the proceeds, became mad, and jumped overboard. Another named Sinclair did the same, was twice rescued, but was drowned at the third attempt. There is a fishing-village in Holland where it is possible to fit out herring-boat or trawler complete with British nets, ropes, warps, trawls, sails, anchors, and cables, that have been obtained from English fishing-boats in exchange for drink. A Dutch bumboat-man boasted that in eight weeks, in the North Sea, he made nine hundred pounds out of the English, French, Dutch, and Belgian fishermen. About two years since, one of these Dutch bumboats was stranded on the Norfolk coast; and her stores—confiscated by the Customs—were found to be two hundred and forty-four pounds of tobacco and cigars; fifty-six gallons of so-called gin, twenty-five per cent. underproof; and half a gallon of perfumed spirits.

The troubles into which the drink demon drives the fishermen may be imagined when the temptation is known to be ever present. The owners' gear is exchanged for drink. The peaceful fishing-smack becomes a pandemonium. Bashed by bashed, the fish caught are unlawfully disposed of, and the men rendered incapable of catching more. The foreign trader first gets all the money he can; but as the fishermen are not in the habit of taking much to sea with them, there is a scarcity of ready coin. Then the masters' fish go, next the nets and gear. Let one instance be given, as a concluding illustration of the evils of the system. The smack *Clara*—not more than two years ago joined a fishing-fleet in the German Ocean, and for a while gratifying cargoes from her regularly reached the owner by the steam-carrier. But the *Clara* fell in with a *cooper*, and thence forth the honest fishing was over. Her crew drank and quarrelled for the space of two months. Such fish as they intermittently caught, they exchanged for poison. By-and-by, the provisions being exhausted, the *Clara* was taken to Heligoland, and her stores sold, to fill the empty lockers. Returning to the fleet, the captain and crew resumed their old practices, until, at the end of thirteen weeks—five weeks overdue—she returned to port in a disgraceful condition. The master and mate were imprisoned. But next year the *Clara* again fell into crooked courses under a fresh master and crew. The *cooper* who now did the mischief was owned by a Hull man, hailing from Bremerhafen; and he contrived to clean the *Clara* out in a fortnight, which ended in a two days' free-fight, and a repetition of the above described dishonesty with the stores at Heligoland. The owners on this one voyage lost seven weeks' fishing; equivalent to an estimated profit of one hundred pounds.

The remedies for these grievances suggest themselves. There must be an international convention to begin with. There was a convention of many years' standing between France and England,

applying to the English Channel, and to the fisheries surrounding the British Isles outside the three-mile zone; but it was not ratified, though there is still an international law operative in the Channel only. The Report of the Royal Commission laid before Parliament during the session of 1881, declares that an international law between England, France, Belgium, and Holland is *urgently* required, and that, until it is devised, the outrages in the North Sea will continue, and cannot be stopped. The fishermen are unanimous in requesting that four swift-sailing cruisers, empowered to enforce the law, one from each nationality, shall be stationed on the fishing-grounds; that the *croppers* shall be swept off the face of the sea; and that the fishing-boats of each nation shall be compelled to carry lights, and be marked with big letters and figures on the bows and mainsails. Before the fishing season of 1882 begins, may these provisions, or others in a similar direction, be put in force, in the true interests of a class who may rest assured in the adapted sentiment of the old proverb, that though they be out of sight, they are not out of mind.

#### EPISTOLARY CURIOSITIES.

VERY curious specimens of the epistolary art are daily consigned to the editorial basket; now and again one escapes into print. An unflattering notice of a musical performance in a London paper elicited a long letter from the offended violinist, in which he asserted that the critic was not present at the entertainment, and announced his desire to have it generally known 'that I look upon all critics who praise me, as men of intelligence, and worthy of the greatest respect; and I look upon those rare ones who dispraise me as having a screw loose in their cerebral development. In conclusion, I consider that if the person who wrote the notice was present at the performance, he is only worthy to be an inmate of a home for idiots; and if he was not present, he is a mean unmanly cur, and should get seven years' hard labour. However, I have not the least doubt but that I will be gaining the applause of admiring thousands when the poor fellow is getting worm-eaten in an unknown and contemptible grave.—Yours obliged, PAGANINI REDIVIVUS.'

A thief thus wrote to the editor of the *New York Tribune*: 'SIR—Please advise your readers always to leave their names and addresses in their pocket-books. It frequently happens in our business that we come into possession of portemonnaies containing private papers and photographs, which we would gladly return; but we have no means of doing so. It is dangerous to carry them about, so we are forced to destroy them. I remember an instance when I met with serious trouble because I could not make up my mind to destroy a picture of a baby, which I had found in the pocket-book of a gentleman, which came into my hands in the way of business in the Third Avenue Road. I had lost a baby myself the year before, of the same age as this

one, and would have given all I had for such a picture. There was no name in the pocket-book, and no way of finding out who was the owner; so, like a fool, I advertised it, and got shadowed by the police. Tell your readers to give us a fair show to be decent, and always leave their addresses in their pocket-books. We want to live and let live.—Yours truly, A PICKPOCKET.'

There was some reason in the light-fingered one's request, which is more than can be said for that of the autograph-hunter begging a well-known journalist's autograph for his album, with: 'If you deem the request unwarranted on my part, pray pardon me; but at the same time, send the refusal in your own handwriting, and with your own signature, that I may know the refusal is authentic.' His impudence deserved as scant courtesy as that yielded by Dickens to an Oxford undergraduate, whose communication running: 'SIR—Understanding that you insert Rhymes in your serial, I send you some;' was answered: 'SIR—We do not insert Rhymes without Reason.'

The world has been reproached with knowing nothing of its greatest benefactors. The charge is too widely drawn; but we must in part admit it, feeling assured that not one of our readers could tell the name of the inventive genius who wrote to a London editor:

'SIR—The subject is a motive-power, regulated by a law of nature, capable of putting into motion the most cumbersome machinery, unintermitting in its action day and night, and free from any cost from one year's end to another, its power unlimited. It is estimated to save the government two hundred thousand pounds per annum in fuel alone, and to reduce the price of coals a hundred per cent., cheapening all manufacturing produce also.'

Getting our coals for nothing would be a consummation devoutly to be wished, indeed; but we fear our inventive genius credits himself with an impossible achievement; like the actress who signed herself, 'Respectfully yours, Miss St George Hussey, *nee* Mrs Hussey.'

Ladies looking for sons-in-law, rarely make their approaches so openly as the Canadian dame who wrote to a newly settled eligible: 'DEAR MR B—, I, Mrs Wigton, wish you would call on my daughter Amelia; she is very amusing, and is a regular young flirt. She can sing like a humming-bird; and her papa can play on the fiddle nicely; and we might have a rare old ho-down; and then we will have an oyster supper. Amelia is highly educated; she can dance like a grasshopper looking for grubs, and she can make beautiful bread; it just tastes like hunny bees' treat; and for pumpkin pies she can't be beat. In fact, she is head of all the F— girls, and will make a good wife for any man.—Yours truly, MRS WIGTON. —Bring your brother.'

In cases where it is quite unnecessary that mothers should trouble themselves in urging things forward, the expression of devotion and undying love is not unfrequently half-comic in its

exaggeration. Here is the outburst of a Californian lover. 'If,' wrote the latter to the object of his affections—'If one atom of the deep, deep love I feel for you is scattered throughout the world, I could stake my life it will fill, if allowed to do so, the entire human race, and thence will derive the word commonly used as love. Good-bye, my dearest dear. Yours till death, and beyond it and eternity.' By-and-by he was sued for breach of promise; and asked what he meant by such language, replied: 'Oh, I couldn't reasonably be expected to explain such stuff.' No explanation was needed in the case of the faithless swain, who abruptly ended a ten years' courtship with: 'DEAR MISS—I write these few lines to say that I don't think you and me should agree if we was to come together. I am generally inclined, and you are the other way, so I beg to be excused.' She would not excuse him; and he had to pay for his default; a fate that befell another fickle gentleman, who took his leave after a tiff, complaining that the lady had put him down so that he could not come up again, and pathetically concluding:

So from you I must part;  
I make the sacrifice from my heart.  
So farewell, Miss Bell;  
Alone I'll dwell.

An Englishman of note wrote to a Mohammedan official for some statistics of the city in which he lived, and was thus politely rebuked for his inquisitiveness: 'MY ILLUSTRIOUS FRIEND AND JOY OF MY LIVER—The thing you ask of me is both difficult and useless. Although I have passed all my days in this place, I have neither counted the houses, nor have I inquired into the number of inhabitants; and as to what one person loads on his mules, and the other stows away in the bottom of his ship, this is no business of mine. But above all, as to the previous history of this city, heaven only knows the amount of dirt and confusion that the Infidels may have eaten before the coming of the sword of Islam. It were unprofitable for us to inquire into it. O my soul! O my lamb! seek not after things which concern thee not. Thou comest unto us, and we welcome thee; go in peace!'

A very different style was adopted by the manager of one of the great Indian railways in addressing a European subordinate given to indulge in needlessly strong language. 'DEAR SIR,' wrote he, 'it is with extreme regret that I have to bring to your notice that I observed very unprofessional conduct on your part this morning when making a trial trip. I allude to the abusive language you used to the drivers and others. This I consider an unwarrantable assumption of my duties and functions, and I may say rights and privileges. Should you wish to abuse any of our employes, I think it will be best in future to do so in regular form, and I beg to point out what I consider this to be. You will please submit to me in writing the form of oath you wish to use; when, if it meets my approval, I shall at once sanction it; but if not, I shall refer the same to the Directors; and in the course of a few weeks, their decision will be known. Perhaps, to save time, it might be as well for you to submit a list of expletives generally in use by you, and I can then at once refer those to which I object to the Directors for their decision. But,

pending that, you will please to understand that all cursing and swearing at drivers and others engaged on the traffic arrangements in which you may wish to indulge must be done in writing, and through me. By adopting this course you will perceive how much responsibility you will save yourself, and how very much the business of the Company will be expedited, and its interests promoted.'

Prominent members of the theatrical profession are too accustomed to receive extraordinary epistles from utter strangers, to take much note of them; but we doubt if any actor ever had a funnier offer made to him than was once made to the elder Booth. Here it is: 'WEST HOUSE SCHOOL, PROSPECT, N.Y., December the eighth, 1818.—MR EDWARD BOOTH.—DEAR SUR AND FRIEND: Heering that you was going to come to Utica to perform in a play called *Hamlet*, I would like to say that us boys is gitting up a Exhibition for the benefit of the diseased soldiers and their widows and orphans, and would like to engage you too take the leading part. I have talked it up with the boys, and we will do the squire thing with you, and I am arterised to make you the following offer. We will come down after you with a good conveyance, and will give you at the rate of Ten Dollars per day and board, and shall want you about one week. If you think it nessary, you can have one or to of our best wimmen actors come up with you; but we can't pay them over three dollars a day and feed. You know how that is yourself, this kind of business is awful uncertain. You can have some fun out of it a hunting deer and foxes around Flamsburgs and Ed. Wilksuns. Please let me know as soon as you can. Yours truly, JAMES SWEET. P. Script.—If you come calling to hunt, get Frank Meyer's hound. She is a good one.'

Our last example of epistolary curiosities came to its astonished recipient in a barrel of American apples bought in the Birmingham market, and ran thus: 'To the Reader—Just for fun I thought I would write this note to tell you these apples were raised in Chester, New Hampshire, U.S.A. They were taken from our place two miles to the depot, and sold for one dollar per barrel. I can only wonder who may read this; whether it be in America or Europe this may go to, some palace, or perhaps some place far inferior. They may be destroyed by fire or water, or perhaps stolen. However, seeing I have wondered so much, I would like to have you write me. I am a young school-teacher, ago about twenty. I live in the country. I have graduated from the High School. I should like a good position as teacher, writer for magazine, or a chance to attend some school, so as I could pay my way.—Wishing you happiness, I am, HARRY M. WARREN.'

The surprised recipient of the simple letter learned one thing from it that interested him—namely, that the barrel of apples for which he paid fifteen shillings, cost the importers, freightage and all, just seven shillings and twopence; so that there must be more unprofitable things to trade in than apples.

Price 1½d.

## SOME HUMOROUS CHAP-BOOKS.

'WHAT are chap-books?' is a question that may well be asked without any loss of dignity, and without the sensation that you are 'exposing your ignorance.' Dearly loved as these little books are by collectors, they are scarce—consequently, somewhat high in price—and very rarely come within the ken of ordinary readers. What has become of the hundreds of thousands of these books that were sold during the last century, is a problem hard to solve. The greater number have become worn, torn, scattered, lost; the few has claimed some; the butterman utilised others; and the devouring maws of the paper-mills have accounted for the extinction of more. Their price was so low—usually a penny—that there was no incentive to preserve them; whilst, being in the form of unsewn tracts, they were exposed to all the accidents of tearing and soiling.

We who in these latter days are so abundantly supplied with cheap and good literature, can hardly refrain from a smile at the mental food that was supplied to the generations who read chap-books. But we must not forget that in cottage-homes and among the labouring classes, money was scarcer then than now, and that the very defective means of intercommunication rendered the visit of the pedler or chapman, who carried these tracts—whence the name—an event to be looked forward to. He certainly carried an assortment of literature to suit all tastes; and his price was so moderate, that any one, almost, could make a purchase from the 'flying stationer,' as he was called in later times. Did you wish Bible stories?—there were Joseph and his Brethren, The Gospel of Nicodemus, The Life of Joseph of Arimathea. Or revel in the diabolical?—then you might have the histories of Friar Bacon and Dr Faustus, or the dread secrets revealed in The Witch of the Woodlands. If any one wanted to go sleepless to bed and start at his own shadow, he could do so by reading The Duke of Buckingham's Father's Ghost, or the Portsmouth or Guildford

Ghost; and if he were purely superstitious, then there were The Interpretation of Dreams and Moles, the prophecies of Nixon and Mother Shipton, and many kinds of Fortune Books. In the department of Romance, you might have Reynard the Fox, Valentine and Orson, Fortunatus, Guy of Warwick, Sir Bevis of Hampton, St George, Patient Grisself, Jack and the Giants, Tom Hickathrift or Tom Thumb; whilst of humorous ones you could have a wide choice. Should your taste run on old stories, Adam Bell, Robin Hood, The Blind Beggar of Bethnal Green, or The Babes in the Wood, might suit you. History ranged from the time of the Romans to Charles I., or later, including Fair Rosamond, Jane Shore, Wat Tyler, and Whittington. There were also short accounts of popular books, such as Sir John Mandeville's Travels, Robinson Crusoe, and many others, even including such different themes as Cookery receipts and Aesop's Fables.

All these, however, are but a tithe of the assortment the purchaser had to choose from. The writer has made a list of over one hundred and twenty issued by one firm alone during the latter half of the last century, a time when chap-books were in their glory, when they had woodcuts which really pertained to them, and were not the miserable reprints, principally published in northern towns in the early part of this century, on bad paper, in wretched worn-out type, and with engravings taken at haphazard.

In giving a few specimens of these old chap-books, let us begin with the Wise Men of Gotham, which was written by Andrew Borde or Boorde, Doctor of Physic, who lived in the end of the fifteenth and beginning of the sixteenth centuries, was educated at Oxford, became a Carthusian monk, and who, on the suppression of his order by Henry VIII., escaped abroad, and travelled over many parts of Europe and some portion of Africa. Settled at Montpellier as a physician, the eccentric doctor also practised as such on his return to England; and from some cause, now unknown, he was imprisoned in the Fleet, where he died in 1549. The Wise Men of Gotham are a collection of

tales of the most amazing and stolid stupidity, of the inhabitants of the county of Nottingham, as tale number three will testify: 'On a time the Men of Gotham would fain have pinned in the Cuckoo, that she might sing all the year. All in the midst of the town they had a hedge made round in compass, and got a Cuckoo, and put her into it, and said: Sing here, and you shall lack neither meat nor drink all the year.—The Cuckoo, when she perceived herself encompassed within the hedge, flew away.—A vengeance on her, said these Wise Men; we made not the hedge high enough.'

Tale five will match it. 'A Man of Gotham bought at Nottingham Market a trivet [or three-legged stool], made of bar-iron, and going home with it, his shoulder grew weary of the carriage; he set it down, and seeing it had three feet, said: Thou hast three feet, and I but two; thou shalt bear me home, if thou wilt. So set himself down on it, saying:

Bear me along as I have bore thee,  
For if thou dost not, thou shalt stand still for me.

The Man of Gotham seeing that his trivet would not move—Stand still, said he, in the Mayor's name, and follow me if thou wilt; and I can show thee the way.—When he went home, his wife asked him where the trivet was. He told her it had three legs, and he but two, and he had taught it the ready way to his house; and therefore it might come home itself if it would.—Where did you leave the trivet? said the woman.—At Gotham Bridge, said he.—So she immediately went and fetched the trivet; otherwise she must have lost it, on account of her husband's want of wit.'

Tale seven is a story of still more crass stupidity. 'One Good-Friday the Men of Gotham consulted together what to do with their white herrings, red herrings, sprats, and salt fish; and agreed that all such fish should be cast into the pond or pool in the middle of the town, that the number of them might increase against the next year. Therefore, every one that had any fish left did cast them immediately into the pond. Then said one: I have as yet gotten left so many red herrings.—Well, said another, and I have left so many whittings.—Another immediately cried out: I have as yet gotten so many sprats left. And said the last: I have as yet gotten so many salt fishes; let them go together in the great pond without distinction, and we may be sure to fare like lords the next year.—At the beginning of the next Lent, they immediately went about drawing the pond, imagining they should have the fish; but were much surprised to find nothing but a great eel.—Ah! said they, a mischief on this eel, for he hath eaten up our fish.—What must we do with him? said one to the other.—Kill him, said one.—Chop him in pieces, said another.—Nay, not so, said the other; let us drown him.—Be it accordingly so, replied them

all. So they immediately went to another pond, and cast the eel into the water.—Lie there, said these wise men, and shift for thyself, since you may not expect any help of us.—So they left the eel to be drowned.' Before dismissing these 'Merrie Tales,' as they are designated on the title-page, it may be stated that there are two Gothams in England—one in Notts, and the other on the south coast—which has led to some difficulty as to which of the two, certain of the tales refer. The honour, however, is certainly a dubious one!

Joe Miller's name is a household word, and it is a proverb to say of a stale joke, 'That is a very old Joe.' He was born in 1684, and died in 1739; and his character is well summed up in his epitaph—which was visible on his tombstone as lately as 1852, in St Clement's burial-ground, Portugal Street, now destroyed: 'Here Lye the Remains of honest Jo MILLER, who was a tender Husband, a Sincere friend, a facetious companion, and an excellent Comedian; &c.

His jests were collected by John Mottley, a dramatist, and first published in 1739. The chap-book version—published about 1750—has many extraneous jokes; but those given below are veritable 'Joes,' and may be found in Mottley's first edition. 'An Irish lawyer of the Temple having occasion to go to dinner, left this direction in the keyhole: Come to the *Elephant and Castle*, where you will find me; and if you cannot read this, carry it to the Stationer's, and he will read it for you.'

'A gentleman who had been a-shooting, brought home a small bird with him, and having an Irish servant, he asked him if he had shot that little bird.—Yes, he told him.—Arrah, by my faith, replied the Irishman, it was not worth the powder and shot, for this little thing would have died in the fall.'

'A young fellow riding down a steep hill, doubting if the foot of it was boggy, called out to a clown that was ditching, and asked if it was hard at the bottom. Ay, answered the countryman; it is hard enough at the bottom, I warrant you. But in half-a-dozen steps the horse sank up to the saddle-girths, which made the young gallant whip and spur and utter oaths. You rascal, said he to the ditcher, didst thou not tell me that it was hard at the bottom?—Ay, said the ditcher; but you are not half-way to the bottom yet.'

'An Englishman and a Welshman disputing in whose country was the best living; said the Welshman: There is such noble housekeeping in Wales, that I have known above a dozen cooks to be employed at one wedding dinner.—Ay, replied the Englishman, that was because every man toasted his own cheese.'

'A certain lady of quality sending her Irish footman to fetch home a pair of new stays, strictly charged him to take a coach if it rained, for fear of wetting them. But a great shower falling, the fellow returned with the stays dripping wet; and being severely reprimanded for not doing as he

was ordered, he said he had obeyed his orders.—How then, answered the lady, could the stays be wet, if you took them in the coach with you?—No, replied honest Teague; I know my place better. I did not get into the coach, but rode behind, as I always used to do.

(One more extract must close this notice of Joe Miller's jests. 'A country clergyman meeting a neighbour who never came to church, although an old fellow about sixty, he gave him some reproof on that account, and asked him if he never read at home.—No, replied the clown; I cannot read.—I daresay, said the parson, you don't know who made you?—Not I, in troth, said the countryman.—A little boy coming by at the time: Who made you, child? said the parson.—God, sir, said the boy.—Why, look you there, quoth the clergyman; are you not ashamed to hear a child five or six years old tell me who made him, when you, who are so old a man, cannot?—Ah! said the countryman, it is no wonder that he should remember; he was made but the other day, and it is a long while, measter, since I was made.'

There were other humorous books, as The Poet's Jestbook, out of which the following are taken. 'Some gentlemen coming to a friend's house, he treated them with some of his own drink, which was flat; but one of the company praising it highly, and being asked the reason, he said, that we ought always to speak well of the devil.'

'A certain shoemaker of Canterbury by his extravagancy had wasted his whole stock: his creditors came so fast on him, he was obliged to pack up and march off. Travelling towards London near Rochester, by the side of a wood stood a gentleman's house, and hard by a couple of turkeys, who, upon his approach, cried out Cobble, cobble, cobble! to which he angrily answered, it was a lie, for it was well known he was no cobbler, but a shoemaker. Being terribly vexed, observing the coast to be clear, he whips up one of the turkeys, clapped it under his coat, and was marching off, but considered he had as good to take the other for company, which he did; but the gentleman saw him through a window, and followed, and overtook him. Said he: Friend, what business have you with that turkey?—Sir, said he, he abused me in calling me cobbler, when it is well known I am a shoemaker.—Ay, but, said the gentleman, what do you intend to do with the other?—Why, truly, sir, said he, I take him to bear witness of my abuse.'

There were riddles, of course; and two chap-books—The Puzzle, and its answer, The Nuts Cracked—contain five hundred and sixteen. As a rule, they are below the average; still, there are some worth preserving, as denoting the feelings of the times. 'Why is Handel so much talked of? Because he is a man of note.—Why is White's Chocolate House like Hercules? Because it has a great Club.—Why is Broughton the Boxer like a good boy? Because he is never beat.—Why

is Broughton the Boxer like a Bachelor? Because he ne'er met with his match.—Why is Orator Henley like a pastrycook? Because he deals in puffs.—Why is Garrick manly enough? Because he does not act a Miss.' Still duller are those in a Whetstone for Dull Wits, Delights for Young Men and Maids, or Wit newly Revived. One of the best in the last is:

Two brothers we are;  
Great burdens we bear,  
By which we are bitterly press'd;  
In truth, we may say  
We are full all the day,  
But empty when we go to rest.

A Pair of Shears.

There is a very peculiar chap-book, which, although it ran through several editions, was never imitated. It was called, A Strange and Wonderful Relation of the Old Woman who was drowned at Ratcliffe Highway, a fortnight ago, &c. A small portion of it will be sufficient to serve as a sample of the whole. 'It was the last Monday morning about four o'clock in the afternoon, before sun-rising, going over Highgate Hill, I asked him if the Old Woman was dead that was drowned at Ratcliffe Highway a few nights ago. He told me he could not tell; but if I went a little farther, I should meet with two young men on horseback, riding under a mare in a blue red jerkin and a pair of white freestone breeches, and they would give intelligence, &c.' And so on the absurdity runs. If to thisrodomontade is added the fact that the illustrations, which are plentiful, are drawn from all sources, irrespective of the text, some idea may be formed of this literary curiosity.

Then there was The Birth, Life, and Death of John Franks, with the Pranks he Played. Though a Mere Fool, which seems really to have been the chronicle of the exploits of a poor idiot who lived near Dunmow. One of the best stories in the little book is the following: 'Jack was often upon the ramble. One day he went up to a yeoman's house who loved to make sport with him. The servants being all busy and abroad, none but the fool and he were together. Mr Sorrel, says Jack, shall we play at blindman's-buff?—Ay, says he, with all my heart, Jack.—You shall be blinded, says Jack.—That I will, Jack, said he. So pinning a napkin about his eyes and head—Now turn about, says Jack. But you see, Mr Sorrel, you see.—No, Jack, said he: I do not see.—Jack shuffled about the kitchen in order to catch him, still crying, You see. But when he found he did not see, he ran to the chimney, and whipt down some puddings, and put them into his pocket. This he did every time he came to that end of the room, till he had filled his pockets and breeches. The doors being open, away runs Jack, leaving the Goodman blindfolded, who, wondering he did not hear the fool, cried out: Jack, Jack! But finding no answer, he pulled off the napkin, and seeing the fool gone, and that he had taken so many puddings with him, was so enraged that he sent his bloodhounds after him; which, when Jack perceived, he takes a pudding and flings it at them. The dogs smelling the pudding, Jack gained ground the time; and still, as the dogs pursued, he threw a pudding at them; and this he did till he came to a house.—This was spread abroad, to the shame and vexation

of the farmer. Some time after, Mr Sorrel and some other tenants went to see the fool's master. Jack espying them, went and told his lady that Mr Sorrel was come. The lady being afraid the fool might offend him by speaking of the puddings, told Jack he should be whipped if he mentioned them. But when they were at dinner, Jack went and shook Mr Sorrel by the hand, saying, How is it, Mr Sorrel? Then seeming to whisper, but speaking so loud that all the company heard him, said: Not a word of the puddings, Mr Sorrel. At this, they all burst into laughter; but the honest man was so ashamed, that he never came there again.

Many other productions of a similar kind might be referred to; but enough has been given to show that the good folks of one hundred years ago had something to laugh at, even if the matter does not quite come up to our nineteenth-century ideas.

### THE FORTUNES OF BERTRAM OAKLEY.

#### CHAPTER XLIX.—UNCLE WALTER AT HOME.

THE chilly sunshine of a London winter's day, when horses' iron-shod feet rang hard upon the metalled roadway, shone in at the bright plate-glass windows of that spacious Kensington villa, the owner of which, as registered in Blue Book and Red Book and Postal Directory, was Walter Denham, Esquire. And within that house was Mr Walter Denham, as busy as a bee, with a meritorious sense of the trouble which he took, such as idle men who ride hobbies are apt to feel, newly arrived from abroad, and engaged in sifting and sorting the treasures that his keen scent for buried rarities had unearthed. The rich spoils that he had gathered were not all from Spain. True, yonder Moorish dagger, with the jewelled haft and the curved blade, and the name of the armourer upon it, in gilt Arabic characters, who made it in distant Fez, when Muley Abderraman was king of Granada, had been got for half its value out of a Seville dealer in curiosities. That splendid Castilian corselet, of steel inlaid with gold, such as Toledo furnished when the aristocracy of Spain were crusading cavaliers, instead of the little betitled gentlemen who now bear their weighty names, had been picked up at Burgos. But there were laces that Roman village priests must have been coaxed to sell, with the consent, doubtless, of their churchwardens; and pictures that had hung long in mouldy Tuscan palaces; and flashing toys made in Paris before the Revolution was a reality.

Uncle Walter bustled gaily to and fro, giving orders, at times, to his Italian valet; and then, with his own white hands, glistening with rings, adjusting the objects that were to decorate rose-wood stands and marble tables and ebony brackets, here and there. The pretty toys that Bertram had seen years before in the same place, were gone. Money in the Funds, money at the Bank, no doubt represented those vanished visions of beauty. But there were fresh toys, half-masked by silken curtains, half-hidden among hot-house flowers, such playthings as a wealthy amateur of art loves to buy.

There came a clang of the gate-bell. There came a tread of many feet, a murmur of voices,

then silence. More than one honest, bull-headed old Paterfamilias, English or Irish, within rifle-range of Walter Denham's model villa, would have felt nervous at the hum and the trampling and the stir. But Mr Walter Denham knew that his butcher was paid, that his grocer was not in arrear, that nobody had the right to hector in the well-kept hall of his villa, and therefore he began to think that something serious must have happened. There was the sound of an altercation, short, summary, and then his foreign man-servant came hurriedly in.

'Signor, the Polizia Inglese!' That was all Luigi said; but he said it with shrugged shoulders, and elevated eyebrows, and tremulous voice. By what he said, he meant much. The Signor, the Padrone, had been found out. To be found out is a serious misfortune anywhere; but in Italy it is a calamity especially serious. Luigi was certain that his master was a ruined man. At Luigi's heels came three men, one in the dark-blue surtout, close-buttoned, of a Superintendent of police, two in ordinary uniform. After them, came in Bertram Oakley. His calm, steady eyes seemed to impress the flighty Uncle Walter more than did the boding aspect of the police.

'In the Queen's name!' said the Superintendent, as he glided round to lay his finger-tips on Uncle Walter's shoulder, and to pronounce the magic formula. 'Here is the warrant, sir, if you would like'—

'Thank you, no!' answered Mr Walter Denham airily, as he recoiled from the piece of stamped paper as from a snake. 'I shouldn't like! But I am quite at your service.—At yours too, Mr Bertram, if this is, as I presume, your work!'

'Say, sir, rather your own work, the sequel of old treachery committed against an unsuspecting brother, long years ago, at Dulchester,' said Bertram, sadly but sternly. 'The sin of former days has found you out at last.'

Uncle Walter winced a little less, as it would seem, under the shock of discovery, than before the quiet scorn that glowed in Bertram's eyes. But he promptly recovered his self-possession, and in a voice of well-feigned astonishment, rejoined: 'You talk in riddles, my very dear sir! I, for one, have no sentimental associations with the sleepy old cathedral city of which I have the honour to be a native. Of what precise offence I am accused, perhaps these gentlemen in blue will condescend to inform me, without thrusting under my eyes again an unpleasant-looking formula, the fresh ink on which smells disagreeably.'

'Forgery, sir, and will-stealing—the indictment will run for conspiracy to effect these,' curtly answered the chief officer of the police, in whose experience a semi-serious prisoner was as a black swan among the ancients.

'I thank you, Superintendent,' said Mr Walter Denham, with elaborate courtesy. 'We had better lose no time, perhaps, in going before whatever authority may be appropriate, and in arranging about the formality—my solicitors will see to that—of what I believe, speaking under correction, for I am not a man of business, is called bail.'

The Superintendent shook his head. 'Bail, sir, in such a case, and with so serious a charge, is not to be thought of. You can ask the magistrate, of course, or your lawyers can; but I'm afraid the thing is impossible.'

'I should like Sowerby and French to be sent for, if not contrary to rule,' said Uncle Walter languidly; 'and, with your permission, I will write a note.' And he sat down at his dainty little table of choice Venetian mosaic, and proceeded to write on tinted paper, emblazoned with his monogram in dead gold, guiding his pen with perfect steadiness.

'You had better, Mr Denham,' said the policeman, 'ask the gentlemen, or one of them, to step round to the police court, Mr Kenyon's, because we shall be obliged to drive there straight from here. The principal witness is to be brought there, and is in waiting by this time.'

'You will be enigmatical,' exclaimed the owner of the Kensington villa with a playful peevishness. 'What surprise awaits me, and what monster is to be produced, as the—I beg your pardon—principal witness?' But, as he spoke, the corners of his well-shaped mouth twitched perceptibly, and the wrinkles around his eyes deepened.

'The monster who is called 'Crawley,' answered Bertram coldly.

And from that moment Mr Walter Denham asked no more questions. He sealed his letter, rang the bell, and despatched it. As he did so, the eyes of the foreign travelling-servant, Luigi, met those of his master. Those of the latter were by far the steadier; but how old, how older by ten years, did Walter Denham look!

'Sì, Signore!' said Luigi, and with a respectful bow, was gone.

'We had better look sharp!' said the police Superintendent. He was the first to suggest that Mr Walter Denham had better take 'a few things' with him, for use in that House of Detention, of the discomforts of which, when, by some blunder, a respectable man of education gets locked up there, we read such piteous newspaper stories. These minor necessities, after heedful inspection, were crammed into a black carpet-bag by the rough hands of a metropolitan constable.

'Luigi,' muttered Uncle Walter, 'would be shocked. But suspicion makes a man acquainted with strange valets.'

Then cabs were called—no Hansoms, but four-wheelers; and into one of these Uncle Walter was resignedly packed, the Superintendent at his side, a private in the Force opposite. The other cab was for Bertram Oakley; and it was not very long before the police court over which Mr Kenyon presided was reached. Mr French, of Sowerby and French, was there, breathless, puzzled, and looking guiltier than his composed client. The proceedings were soon over. 'A remand,' said Uncle Walter—'that means jail! Jail, to me, will be a new sensation.'

## PAVEMENT PORTRAITS.

### AN ACTOR.

ONE day, in the early part of the year, when a drizzling rain was falling, and a cold wind was blowing, I found a man perched on a pair of steps, stretched open in front of a public-house door in that part of the great metropolis termed Great Suffolk Street, Borough, deeply engaged in the exercise of that wonderful art known as 'graining.' He had finished one side of the door; and I was rather struck with the

bold nature of the work he had done. It was evident that the artist went in for broad effect; for the completed portion of his work showed that he was above expending his talent upon the minute representation of little knots and veins, the pride of more laborious, if less ingenious, workers in the same field; and that his object was to represent in a general way a 'woody' effect, with perhaps a dash of marble in it, without condescending to the faithful representation of any known timber.

After looking at the work, I raised my eyes to the worker, and was at once attracted by his somewhat peculiar appearance. He was large, which house-painters as a rule are not; he was old, and in this respect, too, was a remarkable exception to the race to which he belonged. But it was neither his age nor his size which made me look at him a second time. What particularly attracted my attention was the fact that the painter was himself painted! He had a face which was undoubtedly 'made up' with a deal of pains. His moustache, which was thick, was evidently dyed, and it was waxed and curled at the ends; his cheeks were rouged, his eyebrows pencilled, and even one or two blue veins were traced on the temples, from which his thin hair, also dyed black, was brushed back over his ears, mingling in a melancholy sort of little knot behind his head, under the carefully curled brim of a very seedy old hat. But no amount of red, white, black, and blue, however carefully applied, could make this curious 'portrait' look young. Wrinkles furrowed his thin cheeks, crow's-feet were indelibly impressed at the corners of his eyes; his chin was pointed by years; and his thin compressed lips had receded far under the black moustache, after the way of mouths of old people not well attended to by experienced dentists. His eyes, however, seemed full of life, and it was strange to see how earnestly they followed his thin white hand, as it laboured at the peculiar style of decoration on which he was engaged. Every now and then, when a particularly daring stroke was made with the graining tool, the painter would draw back, and, apparently at the risk of overbalancing himself and falling into the gutter, would contemplate with a gleam of unmistakable pride the effect of his handiwork. It was on the completion of one of these artistic *coups*, that the artist, looking round as it were for applause, discovered me regarding him, and asked me from his perch, in a piping, quavering tone, whether I didn't think that it was 'coming on nicely.'

Rather shyly, I answered, in a hesitating way, that I thought it was very good; then, plucking up courage, I inquired whether the style in which he was adorning this shop-front was not quite original.

In one second the painter was off his perch, standing by my side on the pavement; and waving his left hand at the fruit of his labour, while he made a circle in the air with his right, finishing off on his threadbare coat just over where his old heart beat, he turned to me, with a stage-like bend of his body, and said: 'That, sir, is the work of an artist! You mayn't think it; but I was born an artist; not a painter, but

an actor. I've had many ups and downs in my life, and it's fortunate for me that in my earliest years I was taught this trade; for now that the profession to which I belonged for nigh on forty years, is done with me, and won't have anything more to say to one of its oldest and most devoted servants, I'm just able to keep body and soul together with jobs like this.'

The rain at this point came down too hard to admit of the artist resuming his work on the door-post; so we took shelter together within the bar, the outside of which he was embellishing with his wonderful marble-wood design; and while there, with a glass of hot rum-and-water held between his hands, for the agreeable heat which it imparted to his palms, the designer told me something about himself.

Years and years ago, before the writer of these lines was, as his informant said, 'born or thought of,' this actor was treading the boards of a very minor theatre, which, he told me, then existed in the Marylebone Road, in a small pleasure-ground adjoining a public-house called the *Yorkshire Stingo*. It was at this house at which he made his first appearance on any stage. Previously to this aspiring effort, the actor had been, as is intimated above, a journeyman house-painter and decorator. But he always had a taste for the stage; and he used to thrill his fellow-workmen, and others with whom he mixed on evenings when the daily work was done, with recitations in public-house parlours. His turn of mind—speaking in a theatrical sense—was what may be termed 'bloody.' The dagger and the bowl were his delight; the gallows, his glory; crime, especially murder, was his forte. Nearly all his recitations related to deeds of blood; and his muse was in her mildest mood when she dwelt only on frightened maidens, lunatic uncles, and baffled Justice. Highwaymen and their doings were a favourite theme; and many an audience of London shopboys had he in those young days sent home quaking with the stories that he hurled at their inoffensive and empty heads.

Power such as this could not, of course, be confined for ever to pothouses; and it was no wonder that the actor found himself at last on the legitimate boards, a member of 'The Profession.' His debut was not, however, a great success. The theatre was full, but the part was not suitable; and when 'Handsome Jack,' as he was called, appeared as a virtuous young villager, with a chintz waistcoat covered with huge red roses, he was nearly hooted off the stage. He was born a stage villain, and his friends would bear him as nothing else. Matters mended when, on the next night, he strode before the oil footlights of the period in the highest of jackboots, the broadest of brass-ornamented belts, in which was arranged a complete armoury of small-arms, waving in one hand a black flag, emblazoned with a white skull and crossbones, and dragging with the other a fainting maiden. His rightful field was found; and from that night until the end of his theatrical career, which was reached a few years ago, Handsome Jack played the handsome villain in all the plays in which he ever took part.

From the *Yorkshire Stingo* to the *Boyer Saloon* in Stangate, Lambeth, was a decided promotion; and from the latter house to the boards of the *Vic*—as the old *Victoria Theatre* in the Waterloo

Road was lovingly called by its patrons—was an elevation equivalent to that of a commoner to the House of Peers. Handsome Jack never got beyond the *Vic*. He never wished to. Here the summit of his ambition was attained, and he desired nothing more in life than to continue playing his favourite parts to a sympathetic audience in that temple of Thespis. As year after year rolled by, his style became quite tremendous; his voice grew more and more sonorous, his eye rolled with marvellous ferocity, his body grew big, and he literally seemed to fill the stage when he was on it. His combats with cutlass and broadsword were unequalled in all the rest of London; his will was unflinching, his vengeance terrible, his death always daring and defiant. The house sometimes even resented vice being punished in his person; and when this is said, all those who know how absolutely on the side of virtue audiences of the humbler classes are, how adamant in their demands for justice on the oppressor of virtue, will understand the power which Handsome Jack wielded. And how he loved it! He lived, only *when on the stage*; and the rest of his life, although in due time it was shared with a pretty little wife, who was a 'singing chambermaid' by profession, was mere humdrum existence.

But 'humdrum existence' when translated to mean a growing family of eight sons and one sickly daughter, becomes a thing which must be taken into serious consideration by the boldest of buccaneers, the most dare-devil of highwaymen. And so it was with Handsome Jack. As the boys grew up, they one by one, to their shame be it said, proved thorns in the flesh of their actor father. Terrible struggles with debt and domestic difficulties occurred; and these struggles became more than the stage veteran could cope with, when the boys not only failed to assist him, but even lent their aid against their father by the cruel demands they made upon his purse. His daughter, at the age of eighteen, died, and this blow broke the spirit of the handsome villain. From that moment his eye lost its fire, his body its uprightness, his hand its quick cunning at fence, his voice its volume; and the popular favourite went over the top of the hill of his life, and quickly began the descent on the other side.

The downhill process was swiftly made. A benefit was got up for the decaying actor, and a house which produced 'a bumper,' witnessed his last performance on the stage. He played on that night *Claude Duval*, and people said that he never played better in his life. But when he came to make a speech to his 'friends in front' at the end of the entertainment, he, with a sudden recollection of his dead daughter, his cruel sons, his failing powers, crashing into his brain, as he was turning touching phrases to his patrons in pit and gallery, all at once burst out sobbing, and so left the scene of his success for ever!

His wife worked bravely. Handsome Jack, however, I fear gave way for a time to drink. He was taken very ill, and when he reached convalescence, he became conscious that he was a wreck. And so he gave up his profession, and went back to his trade; and here he was—decorating a public-house door.

Such was the sombre history of my artistic friend who, referring to his sons, finished his

recital in these words: 'And would you believe it, sir? I don't know where any single one of all the eight is at this moment to be found! Think of that!'

## CAPTAIN DESMOND'S DAUGHTER.

IN FOUR CHAPTERS.—CHAPTER III.

'WANT me to invest your money, hey? Well, well, I must see what I can do for you, I suppose.' So spoke Sir Theophilus Thorndale the great financier, and promoter of half the 'big things' in the City, to Margaret Desmond. 'What did you say the amount was? A thousand pounds, hey? A very nice little nest-egg. Many a big fortune has sprung from a smaller beginning.'

Then Margaret handed Sir Theophilus her crisp notes for one hundred pounds each, which that gentleman examined in his methodical way, after which he proceeded to make out a receipt for the amount.

'I may tell you, my dear young lady,' resumed the magnate, 'that both Lady Thorndale and myself are much pleased with the way the children have progressed while under your care, and we both consider that very great credit is due to you.—And now there is your receipt.—No, no; you must not refuse it. That would be very foolish and unbusiness-like. Suppose I were to die, what proof would you have that I had ever had the money?'

Four months had elapsed since Captain Desmond's death. The insurance offices, after due inquiry, had paid the ten thousand pounds to the captain's widow, and that lady had at once called upon Margaret with the thousand pounds which was her share of the legacy. For the present, Mrs Desmond had gone to reside at Dieppe with a brother, who had been settled for some years in that sunny town.

Margaret had never mentioned to any one her strange experience at Mardon-le-Willows. To her it seemed something too sacred and mysterious to be talked about. It was never long out of her thoughts when she was alone, but it was still as much a mystery to her as ever it had been. She sometimes wondered how long her father would have stayed with her if she had not started up in bed, if, instead, she had lain still and quietly looked at him. She always burned a light in her room now, and many a time she woke suddenly in the dead middle of the night, half expecting to find her father gazing on her. But he never appeared again.

Margaret often felt very lonely now; and but for her naturally cheerful disposition, and a way she had of looking at the best side of everything, she would probably have grown morbid and discontented with her lot. Although she had seen very little of her father of late years, the knowledge that she had a father had been enough to bring with it a sense of comfort and security. She had never felt altogether lonely while he was alive. But he was gone now, and all her other near relatives were dead; she had reached the age of twenty-two without having ever been engaged, or even in love; it was little wonder that it sometimes seemed to her as if she were alone in the world.

One day, Lady Thorndale said to Margaret: 'I

have decided upon having the portraits of Howard and Irene painted. The artist will be here at noon to-morrow, and will come at the same hour every second day till the picture is completed. It will be necessary for you to remain with the children during the sittings. They will be taken together, with Tycho my deerhound as one of the group. The artist is a Mr Frank Avory, a very rising young man. His picture of the Duchesses of Dulborough's children in this year's Academy has been much talked about.' For Lady Thorndale, this was a very long speech indeed.

Next day brought Mr Frank Avory in due course. The children, dressed for the occasion, and Tycho washed for the occasion, were grouped in the back drawing-room, in accordance with the artist's ideas of what would prove most effective when transferred to canvas. Then Mr Avory set up his easel and began to sketch in his outlines.

Lady Thorndale had suggested that, during the sitting, Miss Desmond should read aloud some interesting story, so as to keep the children's attention engaged and their minds on the alert. Mr Avory agreed with the suggestion; so Margaret seated herself near at hand, and began to read; and what between listening to an exciting story, and watching Mr Avory, the children found full occupation for their eyes and thoughts. Lady Thorndale stayed in the room a quarter of an hour and then went out.

Very few words passed between Mr Avory and Margaret at that first interview. The artist was too anxious to get his outline firmly fixed, to be able to pay much attention to anything else. But on the occasion of his second visit, after the reading for the day was over, and while the children were refreshing themselves with a romp, Mr Avory and Margaret, almost without knowing how it came about, glided into a pleasant stream of talk—talk about Art chiefly, and subjects connected therewith. After this, they both felt like old acquaintances, and as if they had known each other quite a long time; and soon Margaret began to look forward to Frank Avory's visits as to so many sunny breaks in the monotony of her daily life. As for Frank, he had never painted a picture so slowly before, he had never been so fastidious, had never required so many sittings. Lady Thorndale was highly gratified. 'It is indeed a rare thing to see so young an artist so painstaking and conscientious,' she remarked to several of her friends; and she looked forward complacently to the sensation the picture would make in next year's Exhibition.

But no long time had elapsed before our young people found themselves drawn together by a newer and a darker thread of interest, of the existence of which neither of them had dreamed during those first pleasant interviews. Said Frank one day: 'Do you know, Miss Desmond, during the last few weeks I have become very anxious to discover the whereabouts of a certain gentleman who bears the same surname as yourself.'

'The world is wide, and the number of Desmonds in it is probably very considerable,' answered Margaret with a smile.

'The gentleman I am in search of is a certain Captain Marmaduke Desmond.'

Margaret gave a great start. 'My father!' she exclaimed with a gasp.

Frank stared at her for a moment or two without speaking. 'Your father, Miss Desmond! That is indeed singular. How strangely things come about in this world!' He went on painting for a minute or two in silence, and then he said: 'Can you tell me where I can find Captain Desmond?'

'He is dead,' answered Margaret in a low voice, and then the tears rushed to her eyes.

The artist put down his brush and walked to the window. 'I am so sorry!' he said after a moment, and his tone was one of true sympathy. More than once he had wondered for whom Miss Desmond was in mourning.

Margaret controlled her emotion with an effort, and dried her eyes. Presently she said: 'May I ask the reason, Mr Ivory, why you are so anxious to have seen my father?'

'My reason is a very singular one, Miss Desmond. It is now close upon six months ago, since a near relative of mine—my Uncle Caius, my mother's only brother—disappeared most mysteriously, and has not been heard of from that time. So far as can be ascertained, the last person in whose company he is known to have been seen was Captain Desmond.'

Margaret could only sit and gaze at the young painter in speechless surprise.

'If you will allow me,' resumed Ivory, 'I will relate to you the full details of the case, so far as they are known at present.'

He mixed a little fresh colour on his palette, and then went on: 'In the course of last winter, I went to Rome, with the intention of staying there two or three months, for purposes of study. One day towards the end of April, I received a message from my mother urging me to return without delay. My Uncle Caius had left his home more than a fortnight previously, and had not since been heard of. I travelled homeward as fast as I could, only to find, on my arrival in London, that no tidings had yet been received of my uncle, and that my mother was in great distress of mind. I may remark that my uncle was a bachelor of easy means, that he lived in chambers, and that he was a great bookworm and bibliophile, who thought nothing of attending an auction two or three hundred miles away, if there was a chance of picking up a rare folio or a unique black-letter copy. His last known journey was to York, to attend a sale there. It was proved on inquiry that he did attend the sale—he was well known to several people there—and that he started back for London the following Monday morning. He shook hands with one or two acquaintances, who saw him safely into the train; but from that moment all trace of him was lost. So far as could be ascertained, he had never been seen again by any person to whom he was known. Such were the tidings that greeted me on reaching home. So far, all the exertions of the police had failed to elicit anything more.'

'Did you not say that Captain Desmond was the last person with whom your uncle was known to have been seen?' asked Margaret.

'I did. I shall come to that point of the case presently. All that I could do after my return was to urge the police to fresh exertions, and to insert an advertisement in *The Times*, offering a reward for any information respecting my uncle's disappearance. An examination of my uncle's papers and affairs clearly proved that he had

made no preparations for any lengthened stay from home. Well, days and months went on; no one responded to my advertisement; the police were at a standstill; and both my mother and I were slowly coming to the sad conclusion that we should never see or hear anything more of poor Uncle Caius, when one day—one day last week only—I was waited upon by a certain Mr Prestwich, who described himself as a second-hand bookseller in a small way of business. He had been laid up with rheumatic fever for three months, and had not seen my advertisement till a day or two previously, when, on turning over an old file of *The Times*, it had accidentally caught his eye. He had known my uncle by sight for several years, having frequently met him at sales, and having, in addition, more than once done business with him; and he now came to tell me when and where he had last seen him. 'The fourth of April was the last day I met your uncle,' said Mr Prestwich, 'and the place was a railway carriage.'

'The fourth of April!' exclaimed Margaret. 'That was the day on which my father died.'

Frank looked at her with a face full of surprise, then he shook his head. 'There must be a mistake somewhere,' he said. 'It was on the morning of the fourth of April that my uncle started on his return from York, after attending the sale on the previous Saturday. It would appear that at a certain station he changed his seat from one carriage to another, he having been annoyed by what he called some one's "vile tobacco." In this second carriage was Mr Prestwich, who happened to be coming to town by the same train. They had a little talk together, and then my uncle became absorbed in the book he had been reading before. By-and-by they came to a junction where they had to wait ten minutes. My uncle was gazing through the window at the busy scene before him, when Mr Prestwich heard him exclaim: "Good gracious! why, that must be Marmaduke Desmond!" A moment later, his head was out of the window, and he called aloud to a man who was standing some little distance away: "Hi! hi! Captain Desmond, is that you?" The stranger turned, and came up to the carriage; and then he and my uncle shook hands with much cordiality. Mr Prestwich gathered from their conversation that they had not met for nearly twenty years. Then my uncle alighted from the carriage, and the two stood talking on the platform a few yards away. Ultimately, it would appear that Captain Desmond succeeded in persuading my uncle to leave his train and accompany him, presumably to his house. At all events, Mr Prestwich heard him say: "You are a bachelor and your own master; you must come and spend one night with us." My uncle seems to have yielded, since he fetched his little valise out of the carriage, nodded a good-bye to Prestwich, and walked across the platform with Captain Desmond, to where a train for one of the branch-lines was standing ready to start. And that was the last that Mr Prestwich saw of my Uncle Caius.'

Margaret had listened with the deepest attention. 'It is altogether very strange,' she said. 'There could hardly be two Captains Desmond both named Marmaduke. One thing, however, is very certain—Mr Prestwich must be mistaken as to the date. It could not have been on the fourth of April that he saw my father—if he it

was—and your uncle together. As I have already said, it was on that day that my father died.'

'I will see Prestwich again,' said Frank; 'but I am nearly certain that there cannot be any mistake on the point. The sale at York certainly took place on the second of April; and my uncle as certainly stayed there over Sunday, in order to see the minister. It was not till some time after breakfast on Monday morning that he paid his bill and left the hotel. However, I will see Prestwich again, and question him further.'

Margaret awaited Frank's next visit with an impatience to which she had hitherto been a stranger. They had scarcely shaken hands before he said: 'As regards the question of date, Prestwich's evidence is conclusive. There can be no doubt whatever that it was on the fourth of April, and on no other day, that your father and my uncle met at the junction. The next question is, When and where did they part?'

That was indeed the question, but it was one which at first sight there seemed no probability of their being able to answer.

Margaret's mind was busily at work while Frank went on with his painting. At last she said: 'It seems to me that the next thing to do is to write to Mrs Desmond, my step-mother, and ask her whether any stranger came home with my father on the evening of the fourth of April; if so, who the stranger in question was, and when he went away again.'

'A capital suggestion!' said Frank. 'Mrs Desmond may perhaps be able to throw an unexpected light on what now seems enveloped in mystery.'

Margaret despatched her letter that same evening. Three days later, she received Mrs Desmond's reply, which ran as under:

CHERE MARGARET—Why do you write so seldom? You do not know how welcome your letters are, even though you may have very little news to tell me. Pray, write more frequently, if it be only half-a-dozen lines, to say you are well.

The questions you ask in your last letter have caused old wounds to bleed afresh, and have compelled me to live over again in memory the saddest episode of my life. However, I hasten to afford you the information you ask for, feeling sure that you have not been impelled to seek it by mere idle curiosity.

When your father reached home on the afternoon of the fourth of April, he brought with him a tall, lean gentleman about fifty years of age, whom he introduced to me as Mr Caius Freshfield, a very old friend of his. I have an impression that your father and Mr Freshfield had been schoolboys together; in any case, they had not seen each other for a great number of years. Mr Freshfield dined with us, and I had a bedroom got ready for him. You will remember that it was while seated at table that your father was suddenly seized with illness. Mr Freshfield expressed the greatest concern, and assisted to carry him to his room; at the same time it was quite evident that he was a man of an excessively nervous and timid disposition; and after Dr Bond's visit, when there was little or no hope of your father's recovery, he at once expressed his intention of taking his leave. He could be of no service at such a time, and I showed no desire to detain him. He left

the house with the avowed intention of catching the half-past ten o'clock train at the station. In my distress of mind, I never once thought about asking him for his address, and I suppose he never thought about offering it. As a consequence, after your father's death I knew not where to write to him. Had I known his address, I should certainly have invited him to the funeral. From that evening, when he shook hands and bade me good-bye at the foot of the staircase of Larch Cottage, to the present time, I have neither seen nor heard anything of Mr Freshfield, and I am as ignorant of his present whereabouts as the man in the moon.—Believe me, affectionately yours,  
HONORIA DESMOND.

At Frank Ivory's next visit, Miss Desmond read aloud to him that portion of her step-mother's letter which referred to Mr Freshfield.

'The mystery only seems to deepen,' said the young painter sadly. 'That there has been foul-play at work somewhere, I feel more firmly convinced than ever.'

#### THE STORY OF THE NAGA CAMPAIGN.

THE Naga tribes inhabit the district bordering on the Burmese empire, and the same race is to be found within the Burmese territory, in the semi-independent state of Manipur, and in the province known as the Naga Hills. They are skilful gardeners, and have some idea of fortification; and are probably, like the Nepalese and Goorkhas, offshoots of the great Chinese race, which was once paramount over Burmah and all the eastern frontier of Hindustan. Hitherto, the post of Political Agent to the Naga Hills has been one of considerable danger, as three in succession have lost their lives; and the wooded and precipitous nature of the country gives, as on a former occasion we notified in these columns, every facility for guerrilla warfare and ambushes. In November 1878, the British headquarters' station was removed from Samaguting to Kohima, situated on the direct road from Manipur to Assam.

For some years after our occupation of the Naga Hill province, its former suzerain, the Maharajah of Manipur, showed himself very adverse to his British neighbours, and particularly resented the appointment of a Political Agent to his own state. More than once he tried to poison the officer who was charged with that unpleasant duty; but since Lieut.-colonel James Johnstone was nominated resident in 1876, there has been nothing to complain of; on the contrary, the Maharajah himself lent his army in 1878, and again in 1879, to put down a rising in the Naga Hills. Colonel Johnstone, being well acquainted with the language, was able to confer with him without the medium of an interpreter—a very important point in dealing with native princes; and having had much experience in native states, has been able to acquire an influence over him, which has finally converted Kirtee Singh into a valuable ally.

On October 9, 1879, Mr Damant, the Political Agent of the Naga Hills, arrived at Kohima from inspecting the outposts at Dinapur, Samaguting, and Piphima; and in consequence of news received from the large villages of Jotsoma and Konomah, he started again on the 13th for those Naga strongholds with a guard of altogether eighty-nine men.

including constables, frontier police, and men of the 43d Assam Light Infantry. His object was to impress on the Nagas that they must comply with the demands of the government, and pay their taxes, and give the required labour for the carriage of supplies; for although there had been rumours that they were collecting large stores of ammunition, he had no suspicions of their intentions, and therefore did not mean to demand its surrender. He passed the night of the 13th at Jotsoma; and the next day went on to Konomah, in spite of the warning of some friendly Nagas, but found the gate of the town barricaded against him, and was received by a heavy fire. Mr Damant and four men were killed; on which the rest of his guard were scattered and attacked by an ambuscade, which killed thirty-nine and wounded nineteen; and for seven days afterwards, wounded men crawled into Kohima, whither the disastrous news was brought the same day by a fugitive.

The garrison of Kohima consisted of seventy-eight men, with rations for a month; besides which, there were forty police and other non-combatants, women, and children—counting four hundred and ninety-eight in all; and except the rations of the military, only three *mannels* of rice in the shape of provisions. Mr Cawley, the Assistant in charge, on hearing of the Konomah massacre, expected an immediate attack; and sent out letters and telegrams at once to Samaguting and Golaghat in Assam by Naga runners; but these were all intercepted and destroyed. A messenger only just got safely out of Kohima before the Nagas surrounded it, to carry a letter to Wokka, a small station sixty-three miles distant, to ask Mr Herbert Hinde, the Assistant Commissioner there, to bring up his small guard of fifty men. Mr Hinde marched with this contingent for three nights through a hostile country, hiding in the jungle during the day, and succeeded in getting safely into Kohima, where the Nagas had opened a brisk fire on the 14th, and where, for thirteen days, Messrs Cawley and Hinde conducted a most gallant defence. Kohima consists of wooden houses, and was only surrounded by two weak wooden stockades, very ill fitted to maintain a siege. It stands on the slope of a hill, which is crowned by the Naga village of the same name, so that the enemy were able to cut off the general water-supply, leaving only one spring to the garrison, and this was purposely poisoned by the Nagas.

Mr Cawley was from the first obliged to abandon the outer stockade, as he found it untenable; and the women and children—among whom were the widowed Mrs Damant, and Mrs Cawley with her two little girls—could only be sheltered from the showers of bullets and spears by crowding into a large oven and into cellars. The Nagas built up a strong stone wall, behind which they fired, and they were also protected by the village and the jungle. On the 21st, a sortie of the garrison destroyed the stone wall and killed many Nagas; but their companions carried off the dead. That night, the cry of 'mourning for the dead' was raised in the village, and heard within the beleaguered lines of Kohima. Some of the Nagas afterwards stated that the besieging force consisted of six thousand, and that five hundred of these were armed with guns.

They showed great ingenuity in the attack.

Rods weighted with burning cloth were fired into the stockade, where the wooden houses were so numerous, and so close to the fortification, that if one house had been caught, all must have been lost. Many were unroofed by the fire; and if any man endeavoured to slake his thirst by making a rush outside to the spring, he was instantly shot down. The ladies gave up their air-tight packing cases, in which water was stored; but it was horribly foul; and for fourteen days the bulk of the besieged subsisted on a daily ration of a quarter of a *seer* of *atta*, and a little muddy water. The two Englishmen were almost worn out by passing day and night in the trenches, to prevent the Nagas from piling stacks of wood against the stockade and setting fire to it.

On the 21st, Colonel Johnstone, at Manipur, heard of the murder of Mr Damant through the Rajah's minister; and at once prepared to start to the aid of Kohima with an escort of a hundred men. The road between Manipur and the Naga Hills was extremely bad, the jungle not yet having been cleared after the heavy rains; and the men and coolies were so knocked up when about thirty-five miles from their destination, that Colonel Johnstone was obliged to let them halt for a day. About fourteen miles from Kohima, Colonel Johnstone received two urgent messages on slips of paper, brought in the ears of the native bearers for concealment. The messages were as follows: 'Surrounded by Nagas; cut off from water; must be relieved at once. Send flying column to bring away garrison at once. Relief must be immediate to be of any use.' And: 'We are in extremity; come on sharp; Kohima not abandoned;' both signed by Mr Hinde and Mr Cawley. Seven coolies, who had also escaped from the station, gave a deplorable account of the sufferings of the garrison, the food and ammunition being almost exhausted, and the commanders trying to negotiate for a safe passage to Samaguting.

That night, the relieving force halted under arms; and early the next day, as it was still much fatigued, Colonel Johnstone pushed on with fifty Manipuris and sixty-six of his own escort. On the 24th, rumours of the approach of the Manipuri troops under Colonel Johnstone had reached Kohima; but though the Nagas assured the garrison that these were certain to desert to their side, they showed an inclination to come to terms for a passage of the garrison to Samaguting. Yet the besieged felt that even if compelled to accept the terms by starvation, they could not depend upon the good faith of the Nagas, and that they might be all massacred as soon as they left the protection of the stockade. At four P.M., October 27, Colonel Johnstone entered Kohima without shedding a drop of blood, and found the state of things by no means exaggerated. Death and disease had considerably weakened the little garrison; while the non-combatants had been increased by refugees from the friendly natives; so that the total number rescued were three officers, two ladies, two European children, and five hundred and thirty-eight native troops, police, petty officials, women, and children.

Her Majesty sent a sympathising message to Mrs Damant; and the thanks of the Indian government were conveyed to the Maharajah of Manipur and to Colonel Johnstone. The Commander-in-chief of the district, General Nation, sent orders

to Colonel Johnstone to remain on the defensive at Kohima, and not to pursue the retreating Nagas till his own arrival with the guns and a force of regulars. General Nation having arrived with two guns, the force destined to chastise the Naga insurgents left Kohima on November 22.

The situation of Konomah is that of a natural fortress, and the Nagas had taken advantage of it. Lieutenant Ridgeway—who has since received the Victoria Cross—was sent with a company of the 44th N. I. to skirmish up the hill on which it stands; while the main body with the guns gradually ascended by the only passable road, finding on the way the headless corpse of a sepoy in a stream—probably one of Mr Damant's ill-fated expedition. Another party of fifty men under Lieutenant Henderson was sent forward to skirmish in a different direction from Lieutenant Ridgeway; while the guns were carried, under Colonel Johnstone's direction, by his Manipuri coolies, followed by the General and his staff. After incredible labour, they were got into position at about twelve hundred yards distant from the highest point of Konomah, and at once opened fire, while Lieutenant Raban did the same with his rockets; but neither had much effect on the village, and even less on the stone forts. They were consequently moved to within eight hundred yards of the forts; but had still little effect. Meanwhile, a party of the 44th entered an outer stockade, and the General and his staff made their way into the village through the gate where Mr Damant met his death, and which was now surrounded by wounded Nagas. The General, Colonel Johnstone, Major Cook, and the rest of the staff, ascended a kind of stone staircase, and after again passing under the Naga fire, climbed up a perpendicular stone wall to the small tower in the adjoining works which the 44th had already secured. As there was a very small force to hold it, the guns, which were brought up under a heavy fire to their aid, opened on the upper fort at a distance of eighty to a hundred yards. Lieutenant Mansell and his three European bombardiers pointed the guns, but were fully exposed to the enemy, who, throughout the operations, especially picked out the officers with their shot, but appeared not to have the slightest intention of evacuating the works.

Colonel Johnstone, probably thinking of the encouraging effect that a reported repulse of the British would have on the Nagas and their allies who swarmed in the jungles round, strongly urged the need of dislodging the enemy before nightfall, or making a vigorous attempt to do it; and as the guns were still ineffective, they were moved to another point. After several rounds of heavy charges, the order for the assault was given, and nine officers, with as many men as they could collect, rushed out in two parties to scale the front and left sides of the fort. The Nagas met them with a heavy fire and showers of spears and stones, and four of the officers were almost immediately wounded. At last, only three officers and five sepoys were left alone at the foot of the fort, exposed to the whole fire of the enemy; and there was therefore nothing for it but to beat a speedy retreat through the burning embers of the village, which the Nagas had fired an hour before.

Night was coming on, and the ever-active and ready Manipuris threw up entrenchments in spite

of their hard day's work; and soon afterwards the detached corps of the 43d and 44th appeared, to the great relief of the staff, who were unable to tell whether or not they had been cut off. All lay down, officers and men huddled together, to get what rest they could; and Dr Campbell and his medical assistants were unremitting in their care of the wounded. At daybreak, Colonel Johnstone and Captain Williamson set off for the camp at Suchema, to bring up ammunition for a fresh attack; but they had hardly gone three miles, when, thanks to British valour, they saw the British flag floating over the highest fort at Konomah, which had been evacuated, under cover of the conflagration, in the night; although, if the Nagas had continued to hold it, the British force could not have captured it without great loss of life.

The garrison retired precipitately to the Barrail range of hills, eight and nine thousand feet high, where they constructed a fresh series of fortifications; but after two months' obstinate maintenance of their fortresses, hunger prevailed, and the chiefs came in one by one, and offered to give up their arms as an acknowledgment of their submission.

On March 31st, 1860, a telegram was sent from Calcutta to the effect that 'all the Naga chiefs have now submitted to the British, and the operations against them have consequently ceased.' Considering the facility with which the Nagas could obtain arms and ammunition through Burmah, and their numbers and activity, the European officers in that district deserve much credit for having succeeded in suppressing the rebellion within six months, when not more than six hundred men have been hitherto spared for that service. Without the co-operation of the Manipuris, who, five years ago, would have sided with the Nagas against the Empress of India, it would hardly have been possible for them even to have maintained their ground; and the Naga chiefs had bound themselves with an oath never again to allow a European to live in their province.

## BEPPO'S ESCAPE.

### IN TWO CHAPTERS.—CHAPTER I.

IN the early summer of 1879, I was working hard to make up for the time spent during the merry winter in dancing, riding, charade-playing, sight-seeing, and all the thousand-and-one distractions which make it so difficult for an artist, not absolutely compelled to keep the wolf from the door by the use of his pencil, to 'buckle-to' in Rome. I had orders also from obliging friends for two or three paintings in the style I have adopted for my own—small pictures of priests, bishops, cardinals, and other ecclesiastics in their habits as they live.

I was almost alone in Rome; for in June, artists of all nationalities were off to country-sketching; and visitors had departed to the mountains or to England, months ago. I, however, stayed bravely on, in my somewhat shabby rooms, on the fourth piano of a large house in the Via Margutta, working at a picture I intended to call 'Meditation'—a Monsignore in a violet robe, with the red pipings and buttons which make those garments

so effective. I was trying to catch the attitude of Monsignore, just between meditation and slumber, and had placed him on a *loggia*, with a hazy summer view between the pillars of the balustrade before him, with his breviary sliding from between the fingers of one hand, while the other was outstretched on the arm of his chair. It was tiresome; the day was hot, and I could do nothing satisfactorily; so I laid aside my brushes, and thought I would write some letters. Going to fetch my desk from the little den of a bedroom which adjoined my studio, my eye fell on a novel I had thrown down when going to bed the night before. I thought I would finish it; and flinging myself on the bed, I plunged into the woes and ways of the hero and heroine, which soothed me so completely that I fell into a delicious slumber.

I was awakened by the opening of the door which led from the passage into my bedroom, and raising myself, beheld the head of my *padrona* peering cautiously in. On seeing me, she stepped quickly into the room, and said she had come to see if my ewer wanted water. I told her 'no,' and she departed. I sat up, and wondered at this unwonted attention on the part of my landlady, who as often as not left my bedroom for days untended, unless brought to a sense of her neglect by my remonstrances; and also I felt surprised at the look of anxiety which I had certainly seen on her face when she put her head round the doorpost before seeing me. I knew her to be honest as the day, and I believed that she really liked her lodger. She was a widow, with two sons, Beppo and Paolo. Paolo was the one about whom she most frequently discoursed. 'A good lad,' she said, 'and servant to a gentleman in Lombardy.' The other, Beppo, she generally mentioned with a sigh and a shake of the head, usually calling him *poorvino*, and once or twice she had seemed on the point of telling me more about him. I only knew, however, that he had at one time been a 'model' at the Life Academy in Rome, where he was much esteemed for his handsome face, and specially for a glory of soft, curly, dark-brown hair which surrounded his head. On inquiring if he could sit for me, I was told that he had now gone to Naples; but what his occupation was, I knew not.

I went back to my studio, and speedily forgot my *padrona*, in another attempt at the Cardinal's drapery, which gave me trouble, great trouble; for owing to an accident it had sustained, I had been obliged to send the body, one arm, and the legs of my lay-figure, to be mended. I had called many times at old Greffio's, to ask for my wooden beauty; and each time had been put off with excuses, promises, and '*psienzas*' without end; so, it was no easy work to dress up a Cardinal with only the head and one arm of my figure; and all my efforts with rugs, bolster, umbrellas, and sticks, were unavailing.

Two days passed, in which I worked a little, dawdled a great deal, read, wrote, and went out of doors as usual. Yet I could not help noticing that Chiara, my landlady, wore a look of care, and that she was very much more constant in her visits to my rooms. She found, it seemed to me, endless errands calling her thither. I asked her one day, when she was restlessly dusting, or pretending to dust, my furniture, if anything had

disturbed her peace, or if she had any trouble. She disclaimed the idea with much vehemence, and rushed into a stream of talk about 'Paolo,' which made me quickly dismiss her, tired of her son's praises.

The nights were hot, dreadfully hot, and I was worried by sounds behind my bed, for which I could not account. I thought of rats; only the noises were not the usual 'skurry-scurries' of those animals, but sounded like some heavy creature trying to move softly. I said one morning to my landlady: 'What is behind the head of my tent-bed? Is it the wall of the house, or another room, or what?'

She looked alarmed, and replied: 'Signor, I know not. Perhaps a cupboard in the next house comes by the wall there. If the Signor looks at his own room, he will see a cupboard on the other side of the stove; perhaps they have one like it next door.'

'Oh, well,' said I, 'I do wish they would not move things about in it at night.'

Either I slept better, or the noises ceased, for during the next two nights I was undisturbed. On the third day, I was working in my studio, when Chiara rushed in with a telegram in her hand, and a face of great distress. Her Paolo, her boy, had been thrown from his master's carriage and hurt—seriously, she feared; and the telegram summoned her at once to Milan. Poor Chiara! her distress was pitiful. She wept, she invoked all the saints to behold her misfortunes; and she seemed so bewildered and distracted, that it required some time and much patience before I could persuade her that if she meant to go to Milan, she must lose no time in starting, as the slow morning train would leave in little more than an hour. To my surprise, she said she intended going by the quick train, leaving at one o'clock; by which she hoped to return on the next day but one, at about the same time, so as to be at home again after an absence of forty-eight hours only. This puzzled me, as not only are Italians so thrifty by nature, that to pay at all for travelling is a trial to them; but to go by an express train instead of a slow one, would seem to the ordinary Roman mind little less than a sin, as, there being no third class, the difference in price would be something like twelve francs on the two journeys. I could not account, either, for her determination to return so soon, and hinted that Paolo might be too ill for her to leave him, which suggestion made her look positively agonised.

However, she departed, to her packing as I supposed; and though I heard her for some time afterwards fussing about a good deal in my bedroom, I only saw her again for a minute when she came to say 'good-bye.' I asked her if I could do anything for her; for the poor soul's distress touched me; and for a moment she looked on the point of making a request, but changed her mind, and went away.

This was Thursday. On Saturday by mid-day, she hoped to be back; till that time, I should be left to attend on myself. I worked hard till dinner-time, and was only at the café an hour, as I had important letters to write. My correspondence took me till nearly midnight, when I turned in, hoping for slumber, but in vain. I passed a wretched night, and did not fall asleep

till after five o'clock. Friday passed as usual, except that I was more in the studio. I had given up the Monsignore for the present, and was finishing a sketch of a flower-girl, to send to England to a cousin of mine, whose husband, Jack Goddard, would leave Rome for London in a day or two, and take with him his young sister, who had been spending many months in Italy, and whom he had come to fetch. The evening I spent at the open-air theatre in Trastevere, so I did not reach my lodging till late; in fact, it was two o'clock before I could make up my mind to leave the lovely night and betake myself to my tent-bed.

Again the noises close to me began, and I could distinctly hear cautious sounds as of groping and moving, and once, something that sounded like a groan. I could endure it no more. Jumping out of bed, I pulled up the heavy blind, to let in the daylight, and dragged my flimsy couch away from the wall. Apparently, there was nothing to reward my search. The wall-paper, shabby enough, was in an unbroken piece from a kind of dado mark about five feet up, above which the walls were distempered. I knocked, however, and presently pressing my ear against the wall, asked: 'Is any one there?' I listened, and certainly heard a kind of stifled groan. Then I said: 'There is some one in hiding. I shall make a hole in the wall, if I get no answer;' and to emphasise my speech, I began to batter with a stout stick. This brought a hoarse but very distinct whisper, which seemed to come from about the level of my knee, entreating me 'to be silent, and imploring for a single drop of water, for the love of the Holy Virgin.'

Here was a worry! I, a peaceable Englishman, was to be mixed up in some abominable manner with these confounded Italians and their skulking ways. The fellow behind my bed, whatever sort of desperado he was, whether political, social, financial, or natural, would throw himself on my mercy. I should have to conceal and befriend him, and the like. However, reflection would not serve my turn; the poor wretch was there, and in piteous accents he continued to demand, in the name of all the saints in the calendar, for 'but one drop of water.'

'Who are you?' said I; 'and how am I to get you out?'

The weak voice replied: 'I am Beppo, Chiara's son. If you put your fingers under the right-hand corner of the paper here, nearest the stove, and raise the wood, you will touch a little spring, and the door will move.'

I obeyed the directions; and after some raising, pressing, and pulling, the side of the wall up to the dado-line turned outwards, nearly knocking me over; but so quietly, that it was evident the hinges must have been well oiled and the joints considerably used of late. This revealed a quantity of rude lath-and-plaster-work immediately under the dado-line; and down at the bottom, not more than three feet high, was a little cupboard; and there, like a beast in a lair, crouched a figure, with hair of the wildest, and face of the most pinched, pathetic, and despairing expression I had ever seen; and with such eyes! Large, widely distended, with dark rims and long lashes, they looked unnatural; but a glance showed me how striking a feature they would be in their normal state, and I recognised, even in this plight,

the handsome model from the Academy of whom I had been told.

'Why, Beppo,' said I, 'how came you here?'

'Ah, Signor,' he groaned out in reply, 'I am of all men the most wretched, the most miserable. But I die, so it matters not.' As I dragged him out of his hole, the poor fellow fainted, and for some time I thought his words were literally true, and that he was dead. But I lifted him from the floor, and replacing the false wall, which was only like a rude screen, but fastened with careful clasps and hinges, I pushed back my little bed, placed him upon it, and used every means I could think of to revive him. After about an hour, my efforts were rewarded by seeing him able to sit up and slowly drink some mild Chianti wine mixed with a quantity of water, and able also to swallow a few morsels of bread soaked in the same.

I became wonderfully interested in my patient during this time; his obedience, gentleness, and a kind of shrinking humility which betrayed itself in every word and gesture, together with an unmistakable look of extreme terror at any, even the slightest sound for which he did not see a cause, filled my soul with pity. He soon entreated me to let him go back to his den; but this I could not do; and while I made some coffee, I succeeded in soothing his fears sufficiently to allow me to go into the neighbouring street for rolls and butter for breakfast, he the while imploring that I should only bring enough food for one person, or his presence would certainly be discovered. I determined that the 'one' should have a first-rate appetite; and I never remember enjoying any meal more than I did the coffee, cherries, and bread-and-butter I shared with the terror-stricken lad, whose grief for some cause unknown to me, and gratitude at the trifles I had done for him, by turns almost choked him.

Breakfast over, and Beppo somewhat calmer, I succeeded in persuading him to tell me what had brought him into such straits. His tale was certainly a curious and interesting one, told as he told it, in flowery soft Italian, spoken with singular refinement and purity, and with the rapid expressive gesticulation of the Neapolitans he had lately been amongst. He had had a tolerable education; and being very handsome—having a 'picture-face,' as he put it—he found many friends, and was specially liked amongst the best class of artists in Rome, getting well paid as a model at several good studios, and having besides a regular evening engagement at the Life Academy. Unfortunately, the facility with which he made acquaintances was not equalled by the discretion with which he chose them; and some two or three years before our meeting, he had formed a close alliance with a youth who appeared to him extremely fascinating, but who was a prominent member of one of those miserable secret societies which are the chief bane of Italy; and this one appeared to be more than usually of the 'death and destruction' sort. Beppo had been drawn on and on, till he was appointed one of the officers or chiefs of this society, and had to execute the decrees of the 'Supreme Three,' whom he mentioned with extremest awe.

One of these decrees having recently enacted that he should assassinate an old General in Naples, whose only sins appeared to be that he was strongly conservative and a great martinet, he had gone thither for the purpose of obeying his instructions.

His intentions, however, had been frustrated by the prayers and entreaties of a girl to whom he was passionately attached, whose suspicions had been roused by seeing him in Naples. She was a daughter of the landress to the General's family, and a flower-seller on the Chiaja; and having a strong affection for the General and all his family, on account of his and his wife's great kindness to her little brother and sister at a time when there was fever in the house and starvation at the door, she had watched over them with an Italian's devotion, and knowing how much the General was disliked, had feared he might fall a victim to a stab in the dark.

The unwonted presence of Beppo in Naples, the knowledge that he was connected with one of the secret societies, and his gloomy and preoccupied behaviour, had alarmed her. She spent hours in exhorting and entreating him not to have this sin on his soul; declaring that she would denounce him, if the life of the General were attempted either now or later, and finally refusing to see or speak with him for a week. This last had overcome Beppo. To be in the same city, to breathe the same air, but to have no sign of the presence of his innamorata was intolerable. He wrote to tell her that for one hour of her society he would forfeit his soul, his life, and would give up his project. They met; and in spite of his despairing gloom, Nanina refused to believe any harm would happen to him, declared death did not always follow disobedience to the 'Supreme Three,' and insisted on his fleeing to Rome on the very night on which the assassination was to have taken place, assuring him that she would speedily follow, and they would leave Italy in safety together.

#### CHAPTER II.

After hearing Beppo's tale, my sorrow for the poor, terror-haunted, weak-minded lad was only equalled by my extreme bewilderment as to what was to be done with him. There he could not stay. He said he knew, and I believed, that the wonderful 'Three' would certainly make search after their recalcitrant disciple, and a terrible result might follow. Meanwhile, I could think of nothing better than putting him back in his den; and going myself into the studio, to have a turn at my picture for Jack Goddard, I lazily finished up the head of the flower-girl, and placed it on a shelf to dry, when my eyes fell on the unhappy figure I had been attempting to rig up the day before with the bits of my wooden beauty, and the rugs, &c. A happy thought struck me. Why shouldn't Beppo sit to me? I could dress him up as the Cardinal, and no one would dream of interfering with my model. No sooner thought than done! I placed him in my chair of state, where he quickly made himself up in the cleverest way possible. Declaring that he durst not pose as a man, he struck a perfectly wooden attitude; and I was surprised and pleased with the ingenuity with which he made a great display of the one hand and head belonging to my wooden model, and the angularity he threw into his own limbs. Tiring as his position was, he found it, he said, preferable to that in the cupboard; and his long practice as model served to make it less intoler-

able to him. I sat and painted, trying to devise all manner of expedients for the safety of the poor lad, and wondering what Chiara would say and do when she found he was discovered.

Beppo told me that communications were rather slow in his Society, which did not seem to be a very powerful or notable one, and he thought he might exist in Italy for one week after the date of the day on which he ought, as he phrased it, 'to have executed the decrees;' but by that time he felt sure he would be hunted down and assassinated. He seemed to take it quite for granted that there was no resisting the wonderful 'Three.' I, however, did not see it in the same light, and I used my best endeavours to put more pluck and spirit into the poor lad. I painted on till one o'clock, and was about to put up my brushes and take a siesta, when I was interrupted by the entrance of Chiara, looking much heated, and, to my delight, not recognising anything strange in my model.

'How goes it with Paolo?' said I; for Chiara, after a brief greeting, was making for my bedroom door.

'Oh, well! excellently, Signor,' replied she, not pausing in her walk.

I let her go, and waited for the exclamations I knew would follow. In two minutes she came back, her face as white as her apron, and trembling so that she could hardly speak. I could not let her endure the suspense, so I said, laughing: 'Ah, Chiara, your bird is flown.'

She clasped her hands, exclaiming: 'Signor, tell me! How did you discover him? Where is he?'

'Beppo, tell your mother,' said I; and, to the good woman's astonishment, my model began his tale. The exclamations and the embraces that followed, will be readily imagined; and when the pair were calmer, I persuaded Chiara to consider what should be done with her foolish boy. I asked: 'Will he go to England?'

'Certainly,' replied his mother for him, 'if there he will be safe.'

I then assured her that if he could get a situation in a family, he would be quite safe in our beloved Isle. And the happy thought occurred to me of asking Jack Goddard to take him in for a time. He was a thoroughly good-natured fellow. His wife, I knew, had a predilection for foreigners, and a dash of romance in her composition, which would not make it displeasing to her to receive and hide a runaway of this sort. She might perhaps find a place for him amongst some of her numerous friends and acquaintances. I expected Jack in the afternoon to fetch his picture, as he was to leave on Monday, and I determined to appeal to him. This settled, Chiara left us; and I painted on till three o'clock, when I sent Beppo to his den, and took my delayed siesta.

At half-past four we were at work again; and at five, Jack and his sister arrived. After due examination and approbation of the flower-girl, Jack turned to the picture of the Monsignore on the easel; and Emily admired it immensely, saying, 'how difficult it must be to paint a person from that thing,' pointing to my model. This made me laugh. I opened the Monsignore's robe, showed poor Beppo, and told his piteous tale. Great was Jack's interest in it; and he and Emily determined

at once that they would take Beppo with them, as if there were no difficulties of any kind in the way.

'But,' said I, 'your passports might be asked for. You have them, I suppose?'

'Well,' answered Jack, 'I have an old thing which has been my companion for years; but it is never asked for now.'

'Ten to one,' replied I, 'if you don't want to produce it, an inquiry will be made for it.'

'Anyhow, here it is,' said Jack. From an inner pocket he brought out a well-worn leather case, and from it gingerly took a battered paper with many *visas*, and in a very bad state of preservation. It had travelled with him for ten years, and had seen much service.

'This won't do,' said I, after an examination. 'It is made out for you, your wife, and her maid; and here you have your sister and a young man in tow.'

'Oh, bother it!' ejaculated Goddard; 'I had forgotten all about that. But Emily will do for my wife.'

'Well,' said I; 'but Beppo will not do for the "maid,"'

'No, by Jove!' laughed Jack, glancing at Beppo's bush of hair and swarthy face. 'Here's a fix.'

'Wait a moment,' put in Emily. 'We start at dusk, and are going to have a sleeping-car. I don't see why Beppo shouldn't be dressed up in an ulster, with hat and veil and a woman's wig. Then our party would answer the description in the passport. He is slim enough for a girl, and not much too tall.'

'Bravo, Emmie!' said Jack. And after further consultation, it was arranged that Beppo should join them at the station the next evening at seven, being first metamorphosed into a lady's-maid. Emily was to bring the things to me. Chiara, having been called into the council, was delighted, and promised to arrange about the hair-dressing; Emily lending an ulster, hat, and veil, and sundry et ceteras, such as the skirt of a dress, and ribbon, necktie, collar, and gloves.

Beppo took very little part in the talk. When it was in English, he did not of course understand it; and when in Italian, he acquiesced in all arrangements; but appeared to think it hopeless they would be of any avail to save him from his fate.

At seven, Beppo went back to his hiding-place, and I betook myself out to dine, not returning till bedtime. I could not sleep for thinking of the poor lad so uncomfortably cramped up behind my bed, so I got up and begged him to come out and stretch himself on the floor. This, however, he refused to do, and the weary hours dragged on somehow. After breakfast, Beppo said he should like to sit to me again; he seemed to feel safer in that pose than in his den; and accordingly, although it was Sunday, I was soon painting away vigorously.

At eleven, the door was opened suddenly; and Chiara, with the whitest and most despairing of faces, rushed in exclaiming: 'Signor, we are lost! They are coming here to search. Natina has sent a friend to warn me; they will be here immediately.'

Beppo groaned.

'Well,' said I, 'never mind; let them come.

They will search, of course. But look—look at my model; would, could they think it was a man there?—Silence!' I went on, for she was beginning to cry hysterically. 'Everything,' I continued, 'depends on you. When they come, be much surprised, of course. Say, you know nothing of Beppo; but that they can go over all your rooms, if the English gentleman will allow. Then come and ask me. But mind—if you weep or tremble, Beppo is dead!'

This exhortation had a good effect; for Chiara seemed to collect herself, and departed with a firm step.

'Now, Beppo,' said I, 'you are of wood, and you must not breathe.'

Beppo made no answer, and certainly looked most wooden.

Half an hour passed, the longest, I think, I ever spent. Then came sounds of footsteps and talking in the passage. Presently, the steps and voices came through the anteroom; then a pause outside my door, and a knock.

'Come in,' said I; and Chiara appeared, looking quite correctly surprised, indignant, and injured, in fact, acting her part to perfection; and saying in the most respectful manner to me: 'Signor, these gentlemen think I have a criminal in hiding—my poor son, whom God protect!' she added piously. 'They want to walk round your rooms, to look if any one is concealed. They say they will not hurt anything.'

I looked duly astonished; said I 'could not understand how any one could be in my rooms without my knowledge; but that, of course, the gentlemen could look if they pleased, provided they did not disturb me, as I was busy.'

Then the search began. They were four; a most peculiar-looking set of creatures, quite unlike the popular idea of conspirators. Two were fair, of German appearance, with spectacles; one dark and fat; the fourth was an evil-looking old man with gray hair, and eyes like a ferret. They peered into every corner, dragged out tables, displaced chairs, looked under the bed, in the cupboard which did duty for my wardrobe, and even sounded the wall in places; but never came near my model, or moved the bed. I painted on, my heart beating loudly; and my hand, I fancied, shaking visibly. Chiara stood, one hand on her hip, and a look of scorn and injury on her handsome features. By-and-by, the search was over. The four slowly and disappointedly walked away; the little gray-haired man turning back to say spitefully to Chiara: 'Listen! If he were hidden in the earth or the ocean, we should find him; and we *shall*!' he hissed in her ear, as he turned to go.

Chiara shrugged her shoulders. 'As God wills,' she said, and shut the door.

I listened for the retreating footsteps, and then watched from the window till I saw all four issue from the house. They did not leave together; all walked singly, and went different ways, as I could see from my post of vantage. I turned from the window, and said cheerily: 'Now, Beppo, all is easy; to-night you are free.'

For answer, poor Beppo and his heap of clothes slid down on the floor, he in a dead-faint, from which it took time to recover him.

When Chiara had at length succeeded in restoring him, the mother and son had a most melan-

choly conversation, both being persuaded that the vigilance of the 'Three'—of whom the horrid little gray-haired man was one—would not be eluded in the end, and that they would probably return in an hour or two, with fresh information as to the hiding-place.

The rest of the day did not therefore pass cheerfully. I feared lest old Greflio should return my lay-figure; he was fond of bringing his work home on a Sunday. If the conspirators should return, the presence of two such articles would certainly excite suspicion. However, slowly as the time went, it did go; and six o'clock arrived, and with it Jack Goddard and his bright little sister. Chiara meanwhile had fastened a very ugly wig on the boy, which altered him completely. When Emily had put on the skirt, and arranged the cloak, hat, and other small articles of feminine attire, Beppo was certainly disguised beyond recognition. Jack good-naturedly folded up the lad's coat with his own wraps, and stuffed his soft hat into his valise. I confess I was glad when Chiara's parting words were said and her last kiss given. I accompanied the trio to the station, and left them comfortably ensconced in the sleeping-carriage Jack had engaged. I enjoyed my dinner that evening, and slept as I had not done for a week.

Early the next morning, Greflio sent my lay-figure. As a precaution, I rigged it up, and set to work with my painting, thinking that, should the search-party return, it would be better they found all as on the visit of yesterday. It was well I did so. In the course of the forenoon, the door was flung open, and the little gray-haired man, followed by two satellites, rushed in, and without a word of preface or apology, his eyes flashing with spite and rage, dashed furiously across the room, and flung himself on my Cardinal. I saw the gleam of a dagger, heard a savage exclamation of *A morte, traditore!* and then, gray-haired man, lay-figure, chair, and properties were a mingled heap on the floor; for the vicious dagger-thrust which had been intended to execute summary judgment on poor Beppo, had fallen harmless on the wooden breast of my lay-figure!

The scene was so utterly comical, that even the attendant conspirators could not refrain from joining in my hearty peals of laughter, though at the expense of their mortified chief, who, slowly extricating himself from the ruin he had made, ruefully examined his dagger, which was broken at the point, from its encounter with the stern bosom of my wooden image.

'Well, sir,' I exclaimed, 'what apology have you to offer for this conduct? You will have to explain it to one of the gendarmes;' and forthwith I poked my head from the window, shouting 'Police!' Useless, of course, as I knew it would be; for the three men disappeared with lightning rapidity; and it would have been in vain for me to follow them. Besides this, as they were foiled, and Beppo safe, I was glad to let the matter rest where it was. Chiara, of course, had a great deal to say, and her gratitude became somewhat oppressive.

I soon left Rome for England; and am often amused when I go to Goddard's, with the recollection of Beppo's adventure. He has settled down into a steady, useful man-servant; and the terror which for a time haunted him, that even in

London he was not safe from the awful 'Three,' has worn off. Nanina will soon join him, and they propose to set up a lodging-house near the Goddards. May they thrive and prosper!

#### ONE MORE UNFORTUNATE.

THE winds upon the wave are sleeping,  
And softly murmureth the sea;  
The stars in heaven's blue canopy,  
With the bright moon, their watch are keeping.

And by that light so calmly dipping  
Beneath the bridge, between the piers,  
I see the glittering spars, and spears  
Of sails, close-reefed, upon the shipping.

I mark the boatman, late and lonely,  
In silence feathering his oars,  
Glide slowly past the distant hulls,  
That look like giant shadows only.

And from the darkness of the city,  
As from a weary heart, doth come  
The wail of a regretful hum,  
That wakes an answering sigh of pity.

For cold with care, a child of sorrow  
Kneels down to meet the cruel wave;  
Alack! it were a peaceful grave,  
It were a lovable to-morrow!

Poor heart! to weep when all the heaven  
Is glistening in the joy of light;  
Poor heart! to sorrow most at night,  
When care and sorrow are forgiven.

And now a hand in anguish dashes  
Away a clod of tears that tinge  
The fair white light of heaven, and fringe  
The drooping border of her lash.

Anon a hand is raised above her,  
And in sad melody, a prayer  
Goes upward—up the altar stair,  
For maiden frail and faithless lover.

The lights beside the water shiver,  
The sails close-reefed shake on the mast,  
As slowly, slowly goeth past  
A sweet white face adown the river.

In tangled mass the hair is streaming,  
That lately curled in pride of love,  
The sightless eyes are fixed above,  
Wide open, blind to moonlight beaming.

And cast adrift and unforgiven,  
Ye say that soul will be at last,  
That love is lost, that heaven will blast:  
Ah! nought know ye of love or heaven.

## BILLS OF SALE.

Get your coat according to your cloth, is an exploded maxim; the rule now is to have your coat cut according to your fancy, out of somebody else's cloth, and pay for it by instalments. To trade on other people's capital is the modern commercial method; and borrowing, the order of the day. A newly enfranchised nation celebrates its independence by creating a national debt; every city and town with any pretension to importance borrows largely on its rates; landlords add mortgage to mortgage; shopkeepers raise cash upon their credit-bought stock-in-trade; and straitened householders provide themselves with funds by giving what are termed Bills of Sale upon their household goods.

The last-mentioned method of borrowing—well described as a system of artificial credit, springing out of the repeal of the laws in restraint of usury—has developed to a pernicious extent during the last few years. Prior to 1878, a bill of sale did not protect the property covered from the claims of bankruptcy creditors. In that year, however, parliament saw fit to alter the law, and put the holder of a bill of sale—or, in other words, the party who has lent money to the needy householder—in a position to defy all creditors except the landlord. Doubtless, the alteration was made with the very best intentions; but it would seem to be open to question, since the Lord Chancellor has found it expedient to ask the judges and registrars of the County Courts in England and Wales for information 'concerning the recent operation of bills of sale, especially under the Act of 1878.'

Of the seventy-eight officials responding to the appeal, one declined to express any opinion on the matter, and twelve declared themselves satisfied with the working of the Act. The remaining sixty-five pronounced more or less emphatically against it, some unhesitatingly asserting that the law as it stands favours the perpetration of rogeries, and directly encourages fraud. By its means, says one, conspiring men have defeated

justice and fair-dealing by fictitious transactions, supported on the testimony of those who, having had the ingenuity to conceive the plot, have had the daring on oath to support the transaction. Another pronounces almost all bills of sale given by traders to be fraudulent preferences to defeat the recovery of legitimate debts. 'It is a common practice,' says a third, 'for a dishonest debtor to give a friendly bill of sale, and register it, and keep possession of all the goods covered by the bill of sale, and then recklessly run into debt, knowing that he is protected from execution by the bill of sale; and thus holding himself out to the world and to tradesmen as a man of substance, living in a well-appointed house, whilst he has, in fact, placed himself beyond the power of a creditor to enforce payment of any debt, however improperly contracted.'

How swindling is encouraged by this measure is shown by the Huddersfield Registrar. J—W— came into that town as Manager of a branch of a Life Assurance Office. He took a large residence, obtained goods from tradesmen in Huddersfield and elsewhere, furnished his house splendidly, upon credit, and when the last suite of furniture was delivered, gave an auctioneer a bill of sale over the whole. Then he departed, carrying with him fifteen hundred pounds' worth of portable property. What he left behind him was claimed by the holder of the bill of sale; and there being no assets wherewith to contest that document's validity, the creditors never recovered a single penny; while many of them had saddled themselves with policies in the office for which the cheat was agent.

Perhaps the worst result of the Act of 1878 is the enormous increase it has caused in the number of advertising money-lenders, who ply their usurious trade 'to the serious hurt of the poor and illiterate,' and the ruin of nearly all who fall into their clutches. We have counted thirty of these advertisements in one issue of a London morning paper, all of the same pattern, whether emanating from loan-mongers trading in their own or an assumed name, or under the more

imposing guise of Discount Companies, Loan Associations, and Advance Banks, 'National' or 'Imperial.' The traps are all baited alike, with offers of prompt advances on reasonable terms to borrowers of either sex, on mortgage of furniture, farming-stock, implements, and stock-in-trade, without removal, sureties, fees, or publicity. How freely these gentry interpret their own language, was shown by one of the fraternity under cross-examination swearing that when he advertised that the strictest secrecy was observed regarding all transactions, he meant that no information was given to other money-lenders; the registering of a bill of sale, and its publication in *Stubbs' Gazette* and other circulars, being, in his opinion, no violation of the promised secrecy.

The interest required, and exacted, by these money-lenders, ought to put even the needle-t on their guard. Thinking to raise money without any one but himself and the lender being the wiser, a tradesman borrowed a hundred pounds, by bill of sale, from an advertising firm at Nottingham, for which he undertook to pay a hundred and fifty-two pounds, in instalments running over two years. Finding the transaction published in the trade circulars, he desired to pay back the hundred pounds, with a fair addition for the very temporary accommodation, and received the following reply: 'DEAR SIR—Since you were here on Monday last, I have laid the matter before my principals, and they have decided not to depart from their general rule of not allowing any deduction whatever on receiving payment of the amount due on your bill of sale; and they desired me to convey to you their decision. We should be glad to hand over to you the bill of sale upon payment of one hundred and fifty-two pounds; or we should willingly execute a transfer or assignment of the bill of sale to any one who may pay off the same, which transfer or assignment would not require to be re-registered.'

How promise is kept in other respects, we have official testimony. The Sunderland Registrar deposes that there are three features of money-lenders' bills of sale deserving especial notice—an exorbitant rate of interest, from twenty per cent. upwards; the addition of interest to principal, by way of bonus for the advance—the whole sum being made payable by a given number of instalments, and the interest being calculated accordingly—if default is made in any instalment, the whole amount becoming due immediately; and a power of sale so drawn as to be made available on the most frivolous pretexts, and practically at the option of the lender. One of these precious documents, issued by a money-lender in one of the largest manufacturing towns in the north of England, provides that in the event of the borrower becoming a bankrupt, filing a petition for liquidation of his affairs, making deficit in the payment of instalments, or when the mortgagee shall in his own discretion consider the security in any way

liable to be endangered, prejudiced, or disputed—he shall be empowered, without previous notice or demand, to take possession of the property covered by the bill of sale, and sell it forthwith.

Under the above conditions, a farmer borrowed a hundred and sixty pounds, to which eighty pounds was added as 'bonus;' and within three months saw all his effects swept away.—In another instance, we find the borrower giving a bill of sale for eighty pounds, in return for an advance of forty-six pounds six shillings and sixpence.—A milliner obtained a loan of a hundred and thirty-five pounds, and duly paid the first five instalments. Five days before the sixth became due, she tendered the amount to the lender, who refused to accept it then. When the proper time for payment came, the milliner was unprovided with the money; and the following day her property was seized, and would have been sold within a week, had not Vice-Chancellor Malins granted an injunction to restrain the money-lender proceeding to extremities.—A tradesman gave a bill of sale for a hundred pounds, to cover the advance of seventy pounds, with thirty pounds added for interest and expenses; made repayable in weekly instalments of two pounds; failing to pay the second instalment when due, a man was put in possession; and he had to pay a hundred and six pounds to get rid of the bailiff and enjoy his own again, the use of seventy pounds for two months costing him thirty-six pounds.—Mr B—, a woollen-spinner, borrowed eighty pounds of 'an old established firm of Manchester accountants,' on a bill of sale assigning property worth a hundred and eighty pounds, to secure the payment of a hundred and twenty pounds, by quarterly instalments of fifteen pounds. Omitting to pay the first instalment, the next day Mr B— was visited by three men, one of whom took possession of his household furniture, and the others of the contents of his mill. The day after, 'the agent of the bill of sale claimed nine pounds seventeen shillings for costs; which was paid, with five pounds three shillings on account of principal; and in five days a further sum—making a total of a hundred and thirty-six pounds sixteen shillings for a loan of eighty pounds for thirteen weeks.' The money-lenders concerned in the above transactions were not exceptionally extortionate, for a County Court judge writes: 'In almost every case which has come before me on a bill of sale given to professional money-lenders or money-lending societies, the borrower has been cruelly oppressed and defrauded.'

No prey is too petty for these home-wrecking harpies. 'G— W— of Huddersfield, and W— T— of the same place as surety, borrowed of M— the sum of five pounds, upon the security of a bill of sale of W—'s furniture, on the terms of paying five shillings a week for twenty-eight consecutive weeks. By the bill of sale—which was not registered or explained by a solicitor—it was declared that, notwithstanding the proviso for redemption, it should be lawful for the mortgagee at any time after execution of the deed to take possession of the said property, and retain possession of the same until the sum of seven pounds was paid. And in case of default,

it should be lawful for the mortgagee to take possession, and sell, and repay himself all costs, charges, and expenses; the surplus, if any, to be paid to the mortgagor. Only four pounds fifteen shillings was advanced. The principal, W—, having made default, the grantee seized the furniture, and sold it; and having received four pounds in money from the grantor, claimed to hold the proceeds of the furniture for the balance and for the expenses. The matter was compromised out of court.

The loan-monger threatens to become to the artisan what the tallyman is to the artisan's wife. It is quite a common thing now for working-men to borrow sums of two pounds and upwards upon bills of sale, enabling the grantee to take everything his debtor possesses, not excepting his bedding, clothing, and tools. 'In this County Court district,' writes the Tredegar Registrar, 'containing a population of some seventy to eighty thousand, the bulk of which are the working classes, these bills of sale have proved a curse, inasmuch as the unscrupulous lenders push their trade to that extent by thrusting the money, at small amounts, and in nearly every instance under five pounds, on them and their wives and families, with garbled tales and fanciful inducements and promises.' The Registrar of the County Court, East Stonehouse, tells the Lord Chancellor that if he could but see a tithe of the misery caused by these instruments, he would indeed pity the poor. 'Labourers, plasterers, pensioners at a shilling a day, charwomen, and such-like, are often the grantors; and if your Lordship could look through the last year's list of bills of sale registered in this locality, you would be surprised; but that would still leave you entirely uninformed as to the non-registered one.'

That these gentlemen have not exaggerated the state of affairs, is proved conclusively by the Return, recently published, of the Bills of Sale given in England and Wales between the years 1875 and 1880. In the first-named year, but thirty-six bills of sale were granted for amounts of less than ten pounds; while in 1880, the number reached eight thousand eight hundred and seventy-two. From 1876 to 1878, the issue of bills of sale grew from fourteen thousand two hundred and twenty-eight to nineteen thousand five hundred and ninety-six. Then the Bills of Sale Act of 1878 came into operation; and the borrowings upon these instruments rose from two millions seven hundred and sixty thousand and ninety-four pounds, to five millions two hundred and fifty-three thousand two hundred and ninety-one pounds; the number of bills increasing by more than twenty-seven thousand. Of fifty-four thousand two hundred and thirty-two bills of sale given in England and Wales in 1880—416 were for amounts above one thousand pounds; 766 were under one thousand pounds; 3038 under five hundred pounds; 4652 under two hundred pounds; 7183 under one hundred pounds; 15,327 under fifty pounds; 13,978 under twenty pounds; and, as above stated, 8872 under ten pounds. This gives a total of four millions three hundred and thirty-three thousand nine hundred and fourteen pounds! Though the foregoing number is a large one, it is much within the mark, the Return compiled by Messrs Blackham & Co. putting the number of bills of sale issued in 1880 at 56,828.

With such facts before us, and considering the widespread misery they entail, it would be well if the entire system were made the subject of legislative revision.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER I.—MR PRYOR MAKES HIS REPORT.

'I HAVE succeeded, Mr Oakley, succeeded more quickly than I had thought possible, in obtaining information,' said Mr Pryor, of the Private Inquiry Office, in Northumberland Street, Strand.

Bertram had again called upon him, in compliance with a note which he had received; and in the meantime, important events had taken place. Mr Walter Denham, after remands, and energetic protests, and worthy demurrers, well contrived by his pain-taking solicitors and the eminent counsel whom they had persuaded to exhibit their forensic powers in the cramped arena of a police court, had been fairly committed for trial. The prisoner, by his own ingenuity and the aid of his legal advisers, had fought a good fight, disputing every inch of ground, every coin of vantage, in the teeth of crushing proofs. But at last he was committed for trial; Crawley, as Queen's Evidence, being the mainstay of the prosecution, and of course being assured of the immunity which attends such minnows of crime as bear witness against the Tritons. At Southampton, a new Assistant Manager filled Bertram's former place, to the discontent of the rough wrights, who growled that their young favourite's promotion had deprived them of a man who knew by instinct how to manage men. At Blackwall, mighty projects, due to the fertile brain of Bertram Oakley, and approved by the keen intellect of Mr Mervyn, were being carried into execution, with unsparing cost and toil. For marine construction, iron was to replace lumbering wood, steel to replace iron; steam was made to do, in time-saving, what sails had never done; and wherever British bunting flies, a new impetus was to be imparted to the ocean commerce that is the healthy lifeblood of the world. The expense of all this was very great, the risk considerable; but without expense and without risk, no heavy crops can be reaped by sea or land. Already the City Article of the cautious *Times* itself prognosticated for Messrs Mervyn, Lynn, and Oakley a colossal success.

And here was Bertram in the Northumberland Street Office, anxious, pale, watchful of Mr Pryor's inscrutable face, as the sharp-featured, crook-backed dwarf surveyed him with sidelong glances. It was a peculiarity of the Private Inquirer that he was loath to part with the information he had painfully acquired. He doled it out drop by drop, as some druggist of the Middle Ages might have dispensed minims of some noble elixir ascribed to Hermes Trismegistus.

'Mr Pryor, tell me one thing—are my parents alive and well?' asked Bertram eagerly.

'All in good time,' was the ambiguous answer. 'I only beg, I only plead, to tell my story from the beginning.' And Mr Pryor shuffled the papers on the desk before him, as if they were a pack of cards, and after clearing his throat, proceeded:

'I have given very great attention to this

inquiry, Mr Oakley, I can assure you—very great. It has been quite a pet case with me, perhaps because it is so very different from the commissions usually intrusted to me. We have to do so constantly with the darker side of our common humanity, sir, that— Well! I am glad to be reminded that there is such a thing as a silver lining to the cloud. I have taken pains to put these matters into good hands. A man of education—university M.A.—did the Gloucestershire part. My correspondents, Ward and Schuyler, of Chicago, United States, undertook the American department. All things in order,' added Mr Pryor softly, consulting his papers, and then went on: 'You were born, Mr Oakley, at a village, picturesque in its way, called Whitethorn, a few miles out of Gloucester. Whitethorn stands on the declivity of a spur of the hills that traverse the county, and overlooks the Severn. Naturally,' repeated Mr Pryor, 'standing high, it overlooks the Severn'—

'But my father and mother'—Bertram began again.

'All in good time,' said the Private Inquirer, with a deprecatory wave of his outspread fingers. 'Well, sir, your forefathers dwelt, evidently, for many generations in that hamlet. That is proved by the crumbling tombstones among the yews of the churchyard; and by the parish register, very perfect, and in which the name of Oakley constantly occurs, since the time when, in the reign of Henry VIII., Thomas Cromwell, Earl of Essex, and keeper of the Seals and the king's conscience, first invented registers. Well,' pursued Mr Pryor glibly, 'the exact antecedents of your immediate ancestors, Mr Oakley, were, I need not say, a little difficult to disentangle from the confused scraps of oral tradition, which my highly educated emissary could pick up. These yeomen families, land-owners, perhaps, in one generation, tenant-farmers in another, and then possibly artisans, have perplexing ups and downs in the world. Your grandfather, sir, undoubtedly farmed a bit of hill-land—Oakley's Piece, they call it to this day—which had perhaps been freehold once; and his only son, Richard, who was perhaps not robust enough for agriculture, was a master-carpenter in Whitethorn village. He married. A son was born. And then came the emigration to America, the shipwreck, and his own rescue and that of his wife by a passing vessel. Thus your parents reached the New World.'

'But then'—said Bertram, eager to learn more.

'That,' Mr Pryor replied, 'was the really difficult part of our inquiry. People change about so much in the United States, that the Oldest Inhabitant of a township may be perhaps a mere carpet-bagger. If any one in America can scent out a lost individual, Ward and Schuyler are the men; but even they were at fault for some time. No clue, you see. Nothing to guide them. At last—in Missouri it was, in Jackson City—they did hear of a Mr Richard Oakley that had set up some saw-mills, and was formerly considered as a thriving citizen. But, if fortunes are easy come by in the New World, Mr Oakley, they are easy lost. The river—the Mad Missouri, they call it—in one of its sudden floods, that carry down buildings, and grain, and timber, like straws upon the muddy tide—washed away your father's mills and

stock, and turned him into a poor man again. Thence, with great trouble, we traced him into Kansas, and afterwards to Colorado, then a wild, half-settled Territory, ranged by buffalo herds and Indian bands, but where a white man, with industry and luck'—Mr Pryor left off speaking, and fidgeted with the papers before him. Bertram watched him attentively, and augured little good from his evident unwillingness to speak. 'Mr Oakley,' he said suddenly, 'it goes against me, but I must tell the truth. Industry your father had; luck he had not. He settled in Colorado, at a place called Honeyville. There, every evil that could befall a settler, short of being scalped by his savage neighbours, seems to have beset him. The locusts swept his maize-fields as bare as a thrashing-floor; the Indians stampeded his cattle; fever, ague, famine, decimated the settlement; and eight years ago, your father, mother, and a young sister born to them in America, were laid to rest beneath a blazed sapling, in the desolate prairie, with a rude inscription to commemorate the names. Honeyville is a town of twenty thousand people now, I am told, a wealthy mining locality, with hotels, and theatres, and newspaper offices where once log-huts stood; but the prosperity, for those whose memory is dear to you, came too late, sir.'

'It did indeed, and mine as well,' answered Bertram, as he hid his face and wept.

#### CHAPTER XL.—AT THE BAR.

There was a crush of eager sightseers in the Central Criminal Court, for was not Walter Denham, Esq., long known—so the London papers averred—in the artistic circles of the capital as a distinguished virtuoso, to be put on his trial? Elegantly dressed, outwardly calm, the mark of all eyes, the accused took his place in the dock. He preserved his well-bred composure, contemplating the robed and bewigged judges, 'a terrible show,' as Gay's highwayman hero in the *Beggars' Opera* styled them, the 'twelve men in a box,' who compose the palladium of our liberties, the unnecessary array of horse-hair-wearing counsel, the police, the tipstaves, and the spectators, with stoical unconcern. The only eyes from which his seemed to shrink were those of Bertram Oakley, fraught as they were with sad reproach. For the rest, the lover of Art manifested an almost insolent indifference.

The trial began. The Attorney-general, with two colleagues learned in the law—Bagster, Q.C., and a young Mr Mellish—were for the Crown. For the prisoner, very eminent legal assistance had been obtained. Mr Serjeant Silvertongue was a host in himself. He was thought, as many orators are, better for juries than for judges; but the acquittals he had obtained, in defiance of hostile summing-up, were his chief title to the confidence of admiring attorneys. This champion did not stand alone. 'With him,' as the technical phrase is, were Firk, Q.C., Mr Quillet of the Midland Circuit, and a shy, corpulent, middle-aged man, who wore his unaccustomed wig askew, and kept in the background, but who was nevertheless the celebrated barrister Mr Briggs, one of those chamber counsel who really know the law concerning which others merely wrangle.

Sir Richard Sharpe, the Attorney-general of

that period, a hard-hitting man, in and out of parliament, smiled as he surveyed the imposing aspect of the defence. 'Finesse won't do,' he whispered to Mr Bagster, 'when there's a good hand with trumps in it.'

Sir Richard opened the case for the prosecution. He did his duty well and in masterly fashion, using the moral scalpel, so to speak, as unsparingly as ever did surgeon employ the keen-edged steel, and laying bare, stroke after stroke, the ugly inner man which lurked beneath the plausible outside of Mr Walter Denham. There were no flourishes, no attempt at display; but in a cold, passionless way the portrait was traced, the history of the crime made coherent and clear, every statement clenched, as a workman drives home a nail by steady hammer-strokes; no exaggeration anywhere, but merely the exhibition, before heaven and earth, of a bad, artful, heartless man, who, for the meanest of motives, had been guilty of the basest of deeds.

While this scathing philippic went on, every eye in the assemblage eagerly turned to see how the prisoner bore it. Surely he must cower and shrink, under that cruel hail-storm of accusing words, as men recoil from the fiery rain of red-hot cinders, and the blighting glare of the molten lava! But no! With serene, almost disdainful indifference, Uncle Walter listened to the worst that Sir Richard could find to say of him, and remained as apparently unmoved as though he had been a theatrical critic, and the Attorney-general a tragedian on whose performance he was presently to pronounce a professional opinion. When the great lawyer sat down, an all but unanimous verdict of 'Guilty' would have been returned by the throng of spectators in court.

Then young Mr Mellish, the hard-working junior on the Crown side, rose and proposed that the deposition of Nathaniel Lee, deceased, should be 'put in.' Mr Quillet, for the defence, objected. He was there on purpose, if he could, to put a spoke in the wheel of the car of Justice. There was a passage-of-arms between the two learned gentlemen. Firk, Q.C., struck in for the prisoner; while steady Mr Bagster, also in silken gown, came to the help of nervous Mr Mellish. The Bench overruled the objection, and the dying statement of the adventurer was read aloud. You might almost have heard a watch tick, so breathless, so intent, were those who listened greedily to its revelations. The audience seemed indeed to be all ear.

Serjeant Silvertongue and his auxiliaries were not the men to allow this written testimony, this voice from the dead, to pass unquestioned; and so, not having been strong enough to prevent the reading of this important document, they bestirred themselves to destroy, or at anyrate to mitigate its effect. It would be labour lost—Serjeant Silvertongue felt that—to attempt to talk the jury into oblivion of the salient features of Nat Lee's deposition, taken down in the Accident Ward of St Bartholomew's Hospital. The leader for the defence knew the length of the British juryman's foot—so the attorneys who competed for the honour of retaining him were wont to boast—remarkably well. These nice points of law, vexatious to the audience, a weariness to the box, are to the Bench what technicalities of music, cricket, chess are to a select few. Some judges love precedent so

much, that it is only necessary to remind them how Lord Bagwig blundered, or Baron Crankey affirmed perversé propositions, when George III. was king, to bring about reservations, arguments before Courts of Appeal, reversals, and immunity. There was a long tussle, wearisome to the audience, Greek and Hebrew to the junior bar, but full of interest to some tough old seniors, and to their Lordships, no doubt. Firk, Q.C.; and Quillet of the Midland Circuit, did their very best, aided tacitly by Mr Briggs, who kept watch, and pencilled from time to time a few words on a slip of paper, that was passed up to the bewigged gentleman on his feet. No fee, were it half the fortune of a Cræsus, would have induced that eminent chamber counsel, Mr Briggs, to speak. His was the unobtrusive part of prompter in the drama then going on; but after each of his promptings, there came a rustle of robes, and a bending of one judicial head towards another, and a suppressed murmur, and a consultation of books, and a scratching of pens on 'notes,' so called, and then a solemn ruling of the Court.

'Call Henry Crawley!'

Mr Crawley did not need much summoning, but soon exhibited his broad figure, his pasty complexion, and shaggy red eyebrows, in the witness-box. There was a stir of delight among the spectators at this exciting moment, for here was a villain confessed, come to purchase liberty by the betrayal of another villain. His examination in chief was straightforward enough. Crawley's story was substantially that which Nat Lee, on his deathbed, had already told. Queen's Evidence though he was, Sir Richard questioned him gently, almost respectfully. The Attorney-general treated this tolerated knave as old Izak Walton advised us to handle a frog used for pike-fishing, tenderly, lovingly. In a shamefaced way, but clearly enough, Crawley told all. He had forged the will, when once Nat Lee's mechanical ingenuity had conquered the resistance of the lock which secured the safe. The will, produced in court, found at Crawley's lodgings at Notting Hill, was the true will of Mr Robert Denham, the Dulchester banker. It gave the bulk of the property to the eldest son, Dr Denham. The witnesses to the will were yet alive. They had been produced in court. It was worth nobody's while to badger, bait, or annoy those two old gentlemen from Dulchester. Of the contents of the will which they had witnessed they knew no more than we do of the foundation-stone that may underlie the Great Pyramid of King Cheops of Egypt. But they did know that Mr Denham, the banker, had spoken with unswerving esteem of his elder son William, 'who will have plenty, when I am gone,' and had made scanty and disparaging mention of extravagant and idle Walter.

Then Mr Serjeant Silvertongue nodded to Firk, Q.C., and that gentleman, learned in the law, rose to cross-examine Henry Crawley. Firk was good at witnesses. He set to, in a business-like way, at the dissection of this witness.

But Mr Firk, Q.C., found in Crawley a dogged customer. Even old Serjeant Browbeat, that terrible gowmsman, at whose feet Mr Firk had studied when he addicted himself to Old Bailey practice, could not have made much of Henry Crawley, brought to bay. The people who can really be bullied are the nervous men, the timid

recluses, the dishonest men with something to conceal, the vain, reticent women. Where there is a weak spot, Browbeat's disciples can find it out; just as, two hundred years ago, Master Matthew Hopkins the witchfinder, with his probing pins and hot irons, made matters uncomfortable for suspected sorceresses.

But Crawley bore the cross-examination unharmed; just as a favoured person, eight hundred years earlier, walked blindfold among red-hot ploughshares, or grasped the heated ball of the fiery ordeal in a soaped palm. 'Your school nickname, Mr Crawley, was Judas?' said the cross-examining counsel severely. 'You were brought up, Mr Crawley, at the Southampton Police Court, on another charge than this?' 'You subscribed to charitable institutions, and taught in Sunday-schools, I believe, sir?' Every hit told; but, such as the man was, his story hung well together, and it was corroborated by much extraneous evidence.

Firk, Q.C., toiled hard; but though he blackened Crawley, though he showed that vile reptile in his true colours, he did not whiten Mr Walter Denham in the smallest degree.

'It all depends on Silver tongue; he may talk them into it,' said old *nisi prius* heroes of the wig and gown, as the court adjourned for luncheon.

## STUDIES IN ANIMAL LIFE.

### FANTASTIC FRIENDSHIPS.—PART I.

ANIMALS frequently form attachments as whimsical as those formed by men. Why they do so, is one of those curious problems of nature not yet solved. Many of the friendships formed between animals of opposite dispositions and kinds spring out of the instinct of gregariousness, most creatures having a greater dislike to loneliness than even the generality of human beings have. If they cannot obtain a companion of their own kind, they will attach themselves to one of any species that may present itself. Some of their most remarkable and steadfast friendships have been made with human beings. Dogs, and most domestic animals, naturally attach themselves to the people with whom they are brought up and live, and who are frequently the only creatures they have any opportunity of associating with. Many animals, again, naturally conceive a partiality for those who feed or tend them; others entertain gratitude or reverence for those who have done them some kindness. But after all this has been taken into account, there still remain numberless well-authenticated, though not to be readily explained, instances of intense attachments, manifested by non-domestic creatures for human beings.

These curious attachments have been recorded and commented upon from a very early period. Pliny, among other instances, refers to a philosopher named Lacydes who had a goose which took so strong a fancy to him, that it would never leave him day or night, unless removed by force. The goose was his companion wherever he went, follow-

ing him through the public streets, and always striving to be with him indoors. This constancy seemed to the philosopher to be inspired by some religious feelings; he, therefore, carefully tended his strange friend while it lived, and when it died, bestowed upon it a magnificent funeral. Many similar stories of the fidelity of geese towards men are known, but, unfortunately, they have not often been so happy in their termination. The tale told by Bishop Stanley of the old blind woman in Germany who was led to church every Sunday by a gander, is well known; but not so are numerous other anecdotes of the love shown by these birds for human beings. Bishop Stanley, for example, relates how one of a flock of geese suddenly deserted its natural companions, and, for no apparent reason, attached itself to its master, a Cheshire farmer, and followed him everywhere, like a dog. Through the busy streets the faithful creature followed the farmer, as well as about the farm; when he held the plough, the goose marched sedately before him, with firm step and head erect; turning sharply when the furrow was completed, and fixing its eyes intently upon its beloved master, as if to ask his guidance. When the day's work was done, the devoted bird would follow the farmer home, enter the house, and at eventide, as he sat by the fire, would mount his lap, nestle in his bosom, and preen his hair with its beak, as it was wont to do its own feathers. When the farmer went shooting, still the goose would follow him, 'getting over the fences,' to use the man's own words, 'as well as I could myself.' And all this without encouragement, and indeed in spite of persistent discouragement, from its master, who, ultimately, taking into his foolish head a superstitious fear that the bird's strange friendship foreboded ill, inhumanely killed the faithful servitor.

Although, frequently, there is no known cause for geese thus attaching themselves to men, at other times their affection is evidently prompted by gratitude. Buffon records the intense love manifested for him by a young gander which he had rescued from the spite of an older bird. Whenever the naturalist went for a stroll into the woods adjoining his own property, the gander was sure to accompany him, and would follow him for hours in his rambles without any signs of fatigue. Eventually, this close attendance of the faithful bird became somewhat troublesome, as the poor creature persisted in following its master everywhere, to church, to the houses of friends, and so forth. 'On one occasion,' says Buffon, 'it heard me talking in the rector's upper room; and as it found the front door open, it entered, climbed up-stairs, and marching into the room, gave a loud exclamation of joy, to the no slight astonishment of the family.'

Another remarkable instance of gratitude in a goose appeared in the provincial press some years ago. An old bird, of surly habits, living in the neighbourhood of Clythydon, was in the habit of following and attacking every person that passed. One day it tumbled into a deep, narrow drain, whence it was not able to get out again. A labourer passing by discovered the gander in this situation, and compassionately drew it out.

From that time forth, the grateful bird followed its deliverer about like a dog, and allowed him to handle it in any way he liked; but, singular to relate, to every one else it remained as spiteful as ever. Many similar stories of the goose's attachment to certain individuals are known, one of the most often alluded to being that of 'the Elgin goose,' of which it is remarked that change of dress made no difference in its power of distinguishing its noble master the Earl, for in whatever attire he appeared, the bird recognised him; and whenever he spoke to it, responded with an expressive cry of satisfaction.

But the bird so unjustly slandered as 'silly' is not the only feathered creature that adopts human beings as objects of affection. Old Burton, in his delightfully quaint *Anatomy of Melancholy*, alludes to several instances of such things; citing the case of a crane in Majorca that loved a Spaniard, and would walk any distance with him, and in his absence, seek everywhere for him, knocked at his door that he might hear her, and when he took his last farewell, furnished herself. In her *Recollections*, Lady Clementina Davies tells of a clever parrot placed in her charge by its owner, Lady Aldborough, when she went abroad. The bird became greatly attached to Lady Davies, and when, on its proprietor's return, it had to be restored, grew so melancholy that it was feared it would die. Lady Davies was requested, therefore, to come and visit it. Entering the room with a thick veil over her face, the pining bird recognised her in an instant, and tried to fly across the room to her; but was either so weak, or so overpowered with joy, that it fell insensible at her feet. She lifted it up; and, directly it was restored, it began chattering to her in an excited manner, confusing together all its little songs and chatter. It manifested such intense delight at seeing its beloved friend once more, that Lady Aldborough was unable to refrain from giving the bird to her, fearing it might otherwise pine away and die.

In his *Two Years in Victoria*, Howitt gives an interesting account of the fondness displayed by an Australian stork for a man. This bird, known as the 'companion,' probably on account of its sociable habits, forms strong attachments for people. There was one at a store on the Bendigo, says Mr Howitt, running about the diggings, and though often, apparently, in jeopardy from the huge dogs that hunted it, it would not go away. Its great attraction was a stockman, whom it followed about on his rounds. When he came out of his abode in the morning, the bird began to leap and flap its wings and run round him, making the most extraordinary cries; it would then make great jumps, as high as the man's head, cutting the oddest figure with its long legs, its flapping wings, and its gaping beak. The stockman would then say to it: 'Come along, mate; let us go to the horses;' when it would leave off its capering and cries, and walk along soberly by his side. When the man went up to a horse on one side, the bird would go up to it on the other, to stop it; but if the horse offered to come towards it, it hopped away nimbly, and sought protection by the man. Wherever its human companion went, there was the bird to be seen, stalking along at his side.

But a fondness for human companionship is

restricted to neither birds nor domestic animals; the fiercest and apparently least tamable of beasts sometimes showing this unaccountable preference for man. An ancient author cited by Burton remarks, that notwithstanding the many instances of such attachments which he had heard of, he declined to believe them, for fear it should be said he gave credit to fables, until he saw a lynx, that he had received from Africa, so affected towards one of his men that he could no longer doubt. 'When my man was present,' he remarks, 'the beast would use many notable enticements and pleasant motions; and when he was going, hold him back, and look after him when he was gone, very sad in his absence, but most jocund when he returned; and when my man went from me, the beast expressed his love with continual sickness, and after he had pined away some few days, died.'

There are several well-authenticated tales of lions and other members of the cat family having put off this natural savageness when in the society of certain favoured individuals. Without reverting to the time-worn story told by Aulus Gellius, of the slave who was recognised and fawned upon in the arena—where he had been placed for destruction—by a grateful lion whose wounded leg he had formerly cured, numerous anecdotes are available of friendship between *homo* and *felis*. Edmund Kean the tragedian had a puma, or 'American lion,' as it is styled, which was much attached to him, and followed him like a dog. Of the domestic cat, almost as many records of the staunchest affection might be related as of the dog itself. Captain Stables, in his work on *Cats*, furnishes some noteworthy instances; and in the pages of this *Journal* other representative anecdotes have been given. An account of a cat which displays intense and unaccountable partiality for a certain boy in one of our great public schools, was recently brought under our own notice. The boys of a particular ward, to the number of about thirty, sleep in a row of beds, side by side. Every morning, when it is about time to get up, the cat belonging to the ward finds its way to its favourite boy, who is not known to have done anything to propitiate it, jumps on to his bed, nestles down by his side, and purring and caressing, endeavours in every possible way to manifest its affection for him. One day, owing to some alteration of the beds, it jumped on to the wrong one; and when the occupant attempted to stroke it, it became enraged, scratched him, and flew off to its favourite boy. Madame Helvetius had a cat which would not allow any one but its mistress to feed or caress it, and which never attempted to molest the birds which she kept. When its darling mistress died, the poor animal was removed from the room; but the next morning it found its way back, and was discovered on her bed, crying piteously. After the funeral, it was missed, and ultimately was discovered on her grave, dead of grief.

It has been frequently averred that wolves are not tamable, and yet there are several instances known where they have exhibited as great attachment to man as any dog could. In the *Biographia Hibernica*, an affecting anecdote of such a friendship is recounted. A large tame wolf that had been brought up from a cub on board ship, was particularly attached to a certain lieutenant. A violent storm overtook the vessel, and its

destruction appeared certain. The poor animal was sensible of the danger, and whilst its howling was most piteous, it could not be driven from the side of its friend. When the ship broke up, both the officer and the wolf got on to a mast, but were several times washed off, yet again and again, by helping each other, contrived to regain their frail hold. At last the man became benumbed, and so, although they had drifted to within no great distance from the shore, finding that he was unable to support himself any longer, he gave a farewell look and probably an endearing word to his vulpine friend, which loosened its hold on the mast, and claspings its forepaws round its master's neck, they sank together.

An almost equally affecting story of a wolf's affection for a man is told by F. Cuvier. The animal had been brought up like a puppy, and continued with its owner until full grown, when it was presented to the menagerie at Paris. For several weeks it was so disconsolate at the separation from its master, who had been obliged to travel, and so persistently declined food, that it was feared it would die. Eventually, however, its grief moderated, it took its food, and was supposed to have forgotten its former owner. But at the expiration of eighteen months, the master returned; the wolf recognised his voice amid the crowd in the gardens, and upon being released from confinement, bounded towards him, exhibiting violent joy. Again separated from its master, the faithful creature was once more afflicted as on the former occasion, until, after an absence of three years, the object of its affection revisited the gardens. It was evening, and the wolf's den had been shut up for the night; but the instant the man's voice was audible, the poor animal began to utter such anxious cries, that the door of its cage was opened, when it darted towards its friend, leaped upon him, and caressed him, and threatened the keepers, when they attempted to separate them. When its old master finally left it, the animal became ill, refused all food, and although it recovered after a long time, it grew fierce, and resented the familiarities of all strangers. After having once given its affection, it seemed to scorn any further objects of friendship.

That bears can be tamed and domesticated, is well known, and that they often take a liking for those who are kind to them, is no strange thing. In his *Animal Kingdom*, Mr Samuel Goodrich, the American author, tells a curious anecdote of a bear cub which a New Hampshire boy had found and taken home with him. The animal became as docile as a dog, following its youthful friend wherever he went, and even accompanying him every day to school. The distrust which the boy's school-fellows at first had for so singular a companion, gradually wore off, and they became accustomed to feed it from the bags in which they took their meals to school. At the end of two years, the bear wandered into the woods, and could not be discovered. Four years elapsed, and the school passed into other hands, and was attended by a new generation of pupils. One cold winter day, the door of the school having been inadvertently left open, the mistress and her scholars were horrified by the entrance of a large bear. Unable to make their exit by the door, the affrighted woman and children retreated as far into the corners as they could, whilst Master

Bruin, in no way aggressive, warmed himself at the fire. After a while, he turned his attention to the scholars' provision bags and baskets, apparently well remembering where they had been kept. Standing on his hind-feet, he put his paws into the suspended bags, and leisurely satisfied himself with their contents. He then tried the schoolmistress's desk, where some provisions had formerly been kept; but finding it locked, he went to the fire for another warm, and then went off. An alarm was quickly raised, and the young men of the village started after the bear with their guns. His footmarks in the snow were visible; so he was speedily overtaken and shot, when, to their grief, some of the pursuers discovered that they had slain the friend and playmate of their bygone school-days.

Many anecdotes of the fondness shown by elephants for those who have done them any kindness, or for children placed in their charge, are well known; whilst the records of the intense and unselfish love displayed by dogs for certain persons have already filled volumes. 'The defection of the dog,' says a writer in the *Quarterly Review*, 'when his master is in affliction, his feverish anxiety when he is ill, his fury when he is struck by a foe or operated on by a surgeon, his fond efforts at consolation at sight of his tears, and his demonstrations of ecstasy at his restoration to health and cheerfulness, are all facts equally familiar and affecting.' After remarking that an attached dog loves us almost like a fond mother, the reviewer proceeds to cite the following characteristic instance of canine affection, from the *Animal World*: 'A lady was seriously ill, and confined to her bedroom, to which her favourite dog was rarely granted entrance. The servants of the lady daily made beef-tea for her, and threw the meat, after the juice had been extracted, to the dog. Apparently, the animal came to the conclusion that his dear mistress was being starved, or at all events, that his piece of meat would do her good. Waiting a favourable opportunity, he stole into her room with the beef in his mouth; and when she awoke, she found it deposited, as an offering of affection, on her pillow.'

#### DIAMOND ROBBERIES AT THE DIGGINGS.

In the early days of the Cape Diamond Fields, the strict honesty of the community was proverbial; and considering the rough lot congregated together, it was marvellous. The first diamond diggings thrown open to the rush of Cape Colonists were situated on the banks of the Vaal River, about thirty miles from the now celebrated Kimberley. This was in the early part of 1870. At the River Diggings, as they were called, the luck of those who toiled from 'morn till dewy eve' under circumstances of the greatest hardship, and all the various vicissitudes of digging-life, with fever and often death, was varied. Few came out of the turmoil rich, and many worse off than before they left their comfortable homes in the Colony. Good strokes of luck were therefore few and far between; and when a lucky digger extracted a gem of more than the average size, the whole camp became aware of the fact by the digger firing a gun. Then a general rush was

made to the lucky one's claim; and the diamond—sometimes a very large one—would be handed round amongst the crowd of banditti-looking faces, for inspection and valuation. The lucky one would be too busy answering questions from numerous inquirers to notice the whereabouts of his gem; probably it was a hundred yards away by this time, on the outskirts of the large and increasing crowd. Nevertheless, at the words, 'Fork over the stone,' back it would come to the lucky owner, who never in the interim betrayed the least anxiety about it.

Such was the honesty of the River Diggings. But it was too much to expect that such a delightful Utopian state of social perfection could last long. Nor did it. The news of diamond discoveries in South Africa soon reached America, England, and other places, the result of which was that there was soon a constant stream of people, of a questionable class, flowing into South Africa. Old diggers from California and Australia, low blackguards from the purlieus of Whitechapel, runaway sailors, deserters from the army, and any number of the lower class of Jews—these, with a good sprinkling of foreigners, some good and some bad, settled down to try their hands at acquiring a fortune. If it was not to be had the one way, it must be had the other. About this time, the Dry Diggings were opened up, and soon New Rush (now Kimberley) contained about forty thousand inhabitants; and a rough lot they were.

Diamond-dealing had by this time become one of the principal callings of a number of the residents of the camps at the Dry Diggings. The finds had increased to an inordinate extent; and it was not until several banks had been established, which kindly allowed the use of their safes to their customers, that a diamond-dealer had any safer place to deposit his property than in his pocket by day and under his pillow by night.

When a man sleeps in a small canvas tent, and sometimes has as much as three or four thousand pounds' worth of rough diamonds under his pillow or mattress, it was hardly to be wondered at that, now and then, a trial would be made to effect a change in the ownership of valuables, a thousand pounds' worth of which could be easily carried in one's waistcoat pocket. The writer at that time dealt largely in rough diamonds; and it was often on his awakening in the morning that he, with fear and trembling, lifted his pillow, not without some doubts as to the safety of his property. Continual fear of robbery had so accustomed him to alertness, that a footstep a hundred yards off would wake him from a deep sleep; and then with grasped revolver—which was always handy—he would sit up in bed, listening through the darkness, expecting each moment to hear the cat-like footstep and then the gentle ripping of the canvas close to the bed—that might serve to let a man's hand through. If the victim was a heavy sleeper, this plan was often successful. The tents were very small; and even were the bed placed in the centre of the tent, an arm of ordinary length would easily reach the sleeper's pillow, and noiselessly abstract the pocket-book containing the treasure.

It was, however, but seldom that this plan of action met with success. The slightest noise inside the tent gave the thief an idea he was waited for,

and he withdrew quicker than he came, fearing a chance revolver bullet. This 'groping,' as it was called, once, and only once, resulted in the capture of the 'gropers.' It was very cleverly done. A diamond broker one night was awakened out of a heavy sleep by feeling a hand passing over his face. He at once realised his position, and waited breathlessly, as may be imagined, until he felt the hand under his pillow. Luckily, his diamonds were not there; but the owner of the hand seemed by his persistent search to be of a contrary opinion. The broker soon made up his mind to capture the thief. But how? All was darkness within the tent, and making 'a grab' in the dark was doubtful work. If the 'grab' failed, the hand and arm could be quickly withdrawn through the rent in the tent, and then capture would be out of the question. The broker's thoughts reverted to his revolver, which was lying ready cocked at his side; but he was a humane man, and did not like to have a fellow-creature's blood upon his head. However, he made a pounce at the place he considered the hand to be in, and was lucky enough, as he called it, 'to strike it,' and secured a good firm hold of the thief's wrist. It was then a game of pull thief, pull broker; but the broker having two hands to the thief's one, he had the best of it. The broker's shouts quickly awoke his neighbours, who soon came to his assistance; and ultimately gave the would-be thief into custody.

An American named Marshall and his gang made the nights 'lively' for many who had valuables to lose. The use of chloroform was Marshall's own idea, and he carried out his idea with success. Saturated with chloroform, a small sponge on the end of a stick was thrust in, and held over or near the face of the sleeper. 'Groping' was then easy work, as the chances of the victim awakening were slight.

Highway robbery was, strange to say, very rare; and only two cases occurred, though the opportunities for it were frequent.

The great post-office diamond robbery of 1871 was one of the best-planned thefts ever perpetrated at the diggings. It was nearly a success, and the thief had almost escaped to England with his spoil. In fact, he was arrested on board the steamer at Cape Town just as it was leaving. The robbery had taken place two months before, and as the most strenuous endeavours of the New Rush police had resulted in nothing, the robbery was almost forgotten; and but for a slight accident, it would now be amongst the list of undiscovered crimes. The perpetrator of the robbery was a young man of good education and gentlemanly appearance, named Harvey, who emigrated to the Diamond Fields early in 1870. He worked long and toiled hard as a digger, but with no success. He had an honest name too; and it was a pity that when temptation came in his way, he did not manfully resist it. The carelessness of the New Rush postmaster was the cause of the robbery; and had that official exercised even an ordinary precaution in the care of diamonds under his charge, poor Harvey would not now be lying in a convict's grave. The New Rush post-office was merely a wooden shanty, and the postmaster was a genial fellow. On the arrival of the English mail, the small staff of sorters had enough to do. If you knew the postmaster well enough, you were welcome to go in and sort out your own letters.

You could either do this, or wait for your turn, which perhaps might be several hours. Harvey was one of the postmaster's friends, and was often seen availing himself of a friend's privilege. Consequently, he knew the ins and outs of the office, and saw the careless way that packets of rough diamonds were left in the postmaster's private office, prior to being sent away by post. It came out in evidence that he remonstrated with the postmaster as to his want of care, especially leaving the registered packets near a window which was generally open.

It so happened one day that several packets—about thirty-five thousand pounds in value—were registered for transmission to Cape Town and London. They were left as usual on a table waiting for entry and sealing in the register bag. The day was a very hot one, and the window was open as usual. The *Pig and Whistle* canteen was just opposite the post-office, and the postmaster was not adverse to tasting the liquor there, whenever invited by his many friends. On this afternoon, he went once too often. He swore he was not absent five minutes; but no matter how long or how short he was away, on his return the whole of the packets were missing!

Of course, the news spread like wild-fire, and soon there was a large crowd around the post-office. At first, the post-office officials were suspected; but as it was plain that there were none of them in the office at that time of the day, suspicion fell upon hundreds of others equally guiltless. All this time, the real perpetrator was carefully opening the packets and secreting his spoil in his tent, not one hundred yards from the post-office. The slightest breath of suspicion never fell upon him. Weeks passed, and still no clue could be found. Harvey's line of action was indeed clever; he neither excited suspicion by being too officious nor too apathetic on the matter. His whole object, however, was to leave New Rush without exciting more than usual remark. His luck had been bad, and his friends knew it. Although being in possession of an enormous amount of value, a small portion of which he could easily, and without exciting suspicion, have converted into cash, he very artfully borrowed from a friend as much as would pay his fare to Cape Town. There, he said, he would take a situation. He left the diggings unsuspected and unwatched; and, as has been already stated, arrived in Cape Town about two months after the robbery took place. He had a week to wait ere a steamer for England would leave, and here his caution relaxed somewhat. He put up at a first-class hotel, and though not in any way ostentatious, his being there caused some remark from those who had known him at New Rush.

But for a slight *contre-temps*, trivial in itself, Harvey would have been beyond pursuit in a few days. It so happened that on his voyage to the Cape he became acquainted with a fellow-passenger who was better supplied with money than himself. They were both bound for the diggings; but Harvey complained of not having sufficient cash to take him there from Cape Town. His friend, a Mr B—, generously advanced him one hundred pounds, which he promised to return as soon as he possibly could. With the one hundred pounds, Harvey started at once for New

Rush. B— remained in Cape Town for some months, and never saw or heard of Harvey or his hundred pounds until he met him—*en route* for England—in one of the Cape Town streets, about six hours before the steamer was to leave. It must first be mentioned, however, that B—, smarting under the treatment Harvey had given him with respect to the loan, had spoken of the matter to a friend of his, the Clerk of the Peace at Cape Town, and asked his advice if it were possible that criminal proceedings could be instituted in the matter. The debt being only recoverable by civil action, the Clerk of the Peace said he could not interfere, but that he would write to some one at New Rush who would act in the matter. B—, whose knowledge of civil and criminal law appeared to be rather hazy, went away perfectly satisfied at leaving the matter in the hands of his friend the Clerk of the Peace, who probably thought no more of it, or if he did, merely kept his promise by writing to his New Rush friend on the subject. When Harvey was accosted by B—, who tapped him on the shoulder, and said: 'You blackguard, I'll have you arrested!' it can well be imagined the effect those few words had upon him. He turned pale, and nearly fainted. 'Where is my hundred pounds?' demanded B—, holding Harvey by the collar.

'Oh, your hundred pounds,' said the trembling wretch, who now felt a little relieved at knowing it was not for something more he was wanted. 'O yes, my dear fellow; why, I've been looking for you. I'll pay you, old fellow; 'pon my honour, I will. I'm glad I've met you. Didn't know you were here. I would have been so sorry, had I left without seeing you.'

'Oh, that's all fine talk enough,' replied B—. 'Come, let me have the cash, if you have got it.'

'Got it?' said Harvey. 'Ay, and lots more. Look here, old fellow; I've been rather lucky lately—a good find, you know. Mum's the word, as I don't want it known. But as you were good to me when I wanted it, I'll not be mean with you now. I owe you a hundred pounds. Well, there it is; and here is another for interest;' and so saying, he placed two notes in the hand of B—, who was too surprised to say much more than: 'Thank you; I knew, after all, you were of the right sort,' &c. After renewing their friendship together at the bar of the nearest hotel, B— went his way elated.

Now, as luck would have it, the first man that B— met after leaving Harvey, was the Clerk of the Peace.

'Oh,' said B—, 'I'm so glad I have met you. Oblige by not troubling yourself further about that affair of mine—the hundred pounds Harvey owed me. He has just paid me; and the best of the joke is, he has given me a hundred pounds more as interest. Look; here are the notes. Ah! it's a good thing I met him before he left in the steamer to-day. But I should not mention it, as he told me not to say anything about it. Of course what I told you is in strict confidence.'

'Oh, of course,' replied the Clerk of the Peace. 'But where is he now?'

'Just gone into the *Masonic Hotel*. But what does it matter to you where he is now?'

'Oh, nothing. He leaves to-day, you say? I'm glad you have got your money back. But tell me this: did Harvey have any luck at New Rush?'

'Now, that's what I can't understand. It was only yesterday I met Darville, who told me that I might never expect to see a stiver of my money back, as Harvey had to borrow money to get away. Strange, eh?'

'Rather,' replied the Clerk of the Peace sententiously, but who seemed to be thinking of something else all the time.

It was clear that the Clerk's suspicions were aroused in some way, while B—'s were not. There was still a large reward offered by the Diamond Field authorities for the capture of the thief or thieves, and the astute Clerk of the Peace saw his way to a little 'business.' Anyhow, there were reasonable grounds for suspicion, and this was enough for him. So he immediately repaired to his office; and in his capacity as a justice of the peace, at once drew up a warrant to search Harvey's luggage; and placed the warrant in a few minutes in the hands of the police, who went on board the steamer before Harvey made his appearance there. The rest is soon told, as it is needless to add that the suspicions of the Clerk of the Peace were well founded. All the stolen diamonds were found artfully concealed in the barrels of two shot-guns and a rifle. Harvey was tried, found guilty, and sentenced to a long term of imprisonment with hard labour. He died before the completion of his sentence.

There were two other robberies of diamonds connected with the post-office—one from the post-office itself. The perpetrator of this was never discovered. The other was from the post-cart while on its way to Cape Town after leaving Kimberley. A man named Barry, the proprietor of an inn on the banks of the Modder River, carried this out; but being arrested on suspicion, he at once confessed, and showed where he had buried the spoil. Marshall, the American before alluded to, laid a daring plan to systematically rob the post-carts, but an accomplice divulged it; and Marshall was arrested and convicted. Latterly, diamond merchants and others had procured thief-proof safes, so that would-be robbers could not so easily commit depredations as they did in the early days of the New Rush.

As a rule, the diamond-dealing community of Kimberley are honest, though temptations daily come in their way to act otherwise. When people are hourly in the habit of handling valuables, they gradually become careless, and so it was and is with the diamond brokers of Kimberley. Experience seems never to teach them. A Kimberley broker generally carries his diamonds in small paper parcels, about the size of Seidlitz-powder papers, or larger. When he starts on his business rounds in the morning, he has often fifteen or twenty of these in a wallet or large pocket-book. In showing his diamonds to his customers, it has often happened that he leaves a parcel on the table, and forgets to replace it in his book. Perhaps he discovers his loss soon—probably at the next office he shows his goods—but oftener not until he has to return his unsold parcels that afternoon. The writer remembers a diamond merchant once showing him two parcels of diamonds—about one thousand five hundred pounds in value—that had been forgotten by some careless broker. 'I don't know whom they belong to,' he said; 'but I suppose they will be claimed soon.'

They were claimed in a few minutes after by

a broker, who came rushing in, perspiring like a bull, and in his excitement, rudely turning over all the papers on the table, while scrutinizing for the parcels he had missed.

The merchant, with a calmness that was perfectly provoking to the broker, inquired what all this excitement meant.

'I have lost two parcels,' gasped the broker, as he fell exhausted into a chair. 'I can't find them. I can't tell where I left them. Good heavens, I'm a ruined man!' And to do him justice, he really looked it.

The merchant, after keeping the poor fellow on the rack of torture for a few minutes, 'to give him a lesson,' as he said, returned the parcels, but not before they had been properly described in every way.

The above kind of thing often happens. But it is with pleasure that the writer can assert that during his residence in Kimberley, which extended over six years, only two cases occurred in which mislaid parcels of diamonds were not returned to their rightful owners.

The Kimberley diamond trade is almost exclusively in the hands of Jews, whose characteristics as good business-men are proverbial. In making a bargain, they neither take nor give quarter; but in cases like the one just related—and not an isolated one either—their general honesty and straightforwardness cover them with credit.

## CAPTAIN DESMOND'S DAUGHTER.

### IN FOUR CHAPTERS.—CHAPTER IV.

THOSE visits of Frank Avory to the house in Kensington Gardens were becoming dangerously sweet to Margaret Desmond. But they could not last for ever; the picture must be finished some time, and then the visits must come to an end. Life would seem more dull and cheerless than it had ever seemed before, when this one brief ray of sunshine, which had brightened it so pleasantly in passing, should be withdrawn.

One day Sir Theophilus Thorndale met Margaret on the stairs. 'Want some tidings of your nest-egg, perhaps?' he said.—'No? Well, I've some for you, at all events. It's getting on famously. I'm not forgetting to look after it, I can tell you. It will be a fine young chick by-and-by, if all goes on well. Small beginnings—You know the rest. Well, well. Good-day, good-day.'

Miss Desmond was never more surprised in her life than she was one morning about this time by the receipt of a letter bearing the Mardon-le-Willows post-mark. The address was in a writing unfamiliar to her; but on opening the letter, she found that the writer was none other than Frank Avory.

'DEAR MISS DESMOND,' wrote the young artist—'Having nothing very particular to do yesterday, I was suddenly seized by one of those unaccountable impulses to which I am liable at times, and to which I occasionally yield myself, without asking why or wherefore I should do so. The impulse on this occasion took the form of a longing to visit Mardon-le-Willows, the last place from which we have authentic tidings of my uncle having been seen alive. In coming down to this place I had no definite object in view, no expectation of being able to gather any fresh information,

no hope of being able to throw even one additional ray of light on the mystery that enshrouds my poor uncle's fate. Something, however, so strange, so utterly unlooked for, has come to my knowledge during the last few hours, that at present I scarcely know whether to place credence in it or not. My object in writing to you was not to tell you this, but to ask you whether you have by you any portrait or likeness of your father, and if so, whether you will kindly forward it to me by an early post to this place. The greatest care shall be taken of it, and it shall be returned into your hands on Friday next, when I hope to have the pleasure of seeing you, and of explaining to you fully my reasons for making what to you will probably seem a very strange request.—Meanwhile, dear Miss Desmond, believe me very sincerely yours,  
FRANK AVORY.

A strange request truly; and so Margaret could not help thinking when she had read the letter through twice, the second time more carefully than the first. As it happened, she had a portrait of her father, taken some five years previously; and this she at once despatched by post to Mardon-Je-Willows. All that she could then do was to muse and wonder and curb her curiosity as well as she was able, till Friday should arrive. We may be very sure that Frank Avory's letter was not destroyed; rather was it treasured up as something that in a little while would be all that was left to remind her of an episode that would stand out brightly in her life from the dark days that had gone before it, as well as from those which would surely follow.

Friday brought Mr Avory at his usual hour, looking, or so Margaret fancied, a little more grave than common. The painting went on as usual till the little people were released from their enforced quietude, and went off to play at the opposite end of the big room. Then Frank gave into Margaret's hands the portrait she had sent him a few days previously, and thanked her for the loan of it.

'I hope it served the purpose for which you required it?' said Margaret.

'It did indeed—most fully, as I will presently explain to you. I have with me a portrait of my uncle. If you have any curiosity to see it, I will show it you.'

'I should like to see it very much indeed.'

Frank drew a carte-de-visite from his pocket and handed it to Margaret. It was the likeness of a thin-faced, bookish-looking man, with scanty gray hair, a very long upper lip, and no beard or moustache. 'Place the portrait of your father beside it,' said Frank. Margaret did so. 'Two very dissimilar-looking heads, are they not?' asked the painter; and Margaret at once admitted that they were.

The portrait of Captain Desmond depicted a handsome, bold-featured man, with a thick military moustache, and hair that was still plentiful, although not unsprinkled with gray. He seemed to look out at you with a smile, which some people might have called genial, while others would only have deemed it sarcastic. But whether the smile was a pleasant one, or the contrary, it was belied to some extent by the cold watchful look of the eyes, which seemed to follow you everywhere.

'It would scarcely be possible for any one to mistake one of them for the other,' said Frank gravely, as he put away his uncle's portrait. He rose, crossed to the window, looked out for a moment or two, and then went back to his chair. 'I have a very extraordinary narrative to relate to you, Miss Desmond, and I hardly know how to begin it,' he said.

Margaret's large serious eyes were fixed on his face; the fingers of one hand were interknit with those of the other. She did not speak, but waited to hear more.

'I have already told you how I was led by a sort of unaccountable impulse to go down to Mardon,' resumed Frank, 'and that I was without any definite view in making the journey in question. When I reached the little village, it was still early in the afternoon. I readily found the house where your father had resided. It was untenanted except by an old man and his wife, who take care of the premises. By-and-by I found myself in the churchyard on the hill. I looked for your father's grave, but could find no headstone or memorial of any kind to mark it out from the others. After that, I made my way down to the shore, and sat sketching for a couple of hours, by which time it became needful to think of finding the village inn and something to eat.'

'I was still some distance from the inn, when I came to a small old-fashioned red brick house, standing a little way back from the road in a pleasant garden. On the green gate which gave admittance to this tiny demesne was a brass plate with the words "Dr Bond" engraved on it; while in the garden was an elderly gentleman in a straw-hat, with his sleeves turned up, and a pair of shears in his hands, who was evidently none other than Dr Bond himself. The sight of the name on the brass plate brought at once to my mind the fact that Dr Bond was the practitioner who was called in to your father on the night of his death, in which case he was probably one of the last people who saw my uncle previously to his departure from Mardon. There could be no harm in putting a few questions to him.'

'I watched him for a minute or two without speaking; and then I opened the gate and entered the garden. "Dr Bond, I presume?" I said.

"That's me," he answered with a nod.

"Pardon the question," I said; "but were you not in the course of last April called in professionally to Larch Cottage, to see a gentleman there of the name of Captain Desmond?"

"Certainly I was," answered the doctor. "Very bad case. Nothing could be done. Past all the medical skill in the world."

"Did you, at the time you saw Captain Desmond, see also a friend of his, a gentleman who had arrived at the Cottage that evening on a short visit?"

"Of course I did. I remember him quite well, and very much put about he seemed by his friend's sudden illness. A Mr—Mr—really I forget the name."

"Mr Freshfield, was it not?" I suggested.

"That was it—Freshfield," he answered in a moment.

"You are perhaps aware," I said, "that Mr Freshfield left Larch Cottage the same evening, without waiting to hear the result of Captain

Desmond's illness, and that his intention was to return to London by the half-past ten train?"

"I don't know anything about the gentleman's intentions; but I believe I did hear, when I called again, that he was gone—that, however, was no concern of mine. But may I ask, young sir, the object of all these questions?"

"I am Mr Freshfield's nephew," I answered. "From the moment my uncle left Larch Cottage on the night of the 4th of April, he was never seen again by any of his friends. He never has been seen by them from that time to this. He disappeared as utterly as if the earth had swallowed him up."

"Dr Bond pushed up his spectacles and stared at me with his mouth agape. "A most extraordinary tale, young gentleman—most extraordinary!" he said.

"Although you only saw Mr Freshfield once and for a very short time," I said, "you would probably recognise him again if you were to see his portrait." With that, I put into the doctor's hands the likeness which I showed you a few minutes ago, Miss Desmond. Down came his spectacles as he took it between his thumb and finger. Then holding it so that the light of the setting sun shone full on it, and pursing up his lips with a critical air, he scrutinised it carefully.

"Bless my heart, young gentleman," he said presently, "there's a mistake somewhere! This is the likeness of Captain Desmond, the man who died; not of his friend, whom you spoke of just now; and a very good likeness too."

"For the moment, I was too surprised to make any reply. Then I said: "Pardon me, sir, for seeming to doubt the accuracy of your memory; but this is certainly the portrait, not of Captain Desmond, but of my uncle, Mr Freshfield. That is a point on which I cannot possibly be mistaken."

"Dr Bond grew very red in the face. "Tilly-willy! young sir," he exclaimed irascibly; "whether it's the likeness of your uncle or whether it isn't, I neither know nor care. All I say is, and I'll stick to it, that it's the likeness of the man who died at Larch Cottage one night last April.—But my dinner's getting cold, and I must go; and so good-evening to you."

"I went on my way to the inn like a dazed man. I knew not what to think, what to do. Later on in the evening, I wrote that note to you in which I asked you to send me your father's portrait, and decided not to leave Mardon till I should receive your reply. As soon as the portrait came to hand, I went to Dr Bond for the second time. "Will you oblige me by telling me whether you recognise this as the likeness of any one whom you have ever seen?" I said.

"He had scarcely set eyes on it before he said: "Ah, now I see that you have found out your mistake. This is the likeness of Captain Desmond's friend, the gentleman who went away the evening he died—Mr Freshfield, I think you called him."

"It was but the day before yesterday, Miss Desmond, that these words were said to me. I have nothing more to add. You now know as much as I know myself. That my uncle is dead, there seems little or no reason to doubt; but why he and Captain Desmond should have exchanged

names and identities, is a mystery which I confess myself utterly unable to fathom. Can you help me to a clue? Can you illumine my darkness with even the faintest glimmer of light?"

Margaret was sitting with blanched face and staring eyes. She had not interrupted Frank's narrative by a word. She started when he appealed to her thus directly, and tried to speak, but the words died away on her lips. Frank walked to the window, to give her time to recover herself. Presently she said: "What you have just told me, Mr Avory, surprises me as utterly as it can possibly have surprised you. It is a mystery to which I have not the faintest clue; it is something so utterly unaccountable, that I can scarcely credit that my ears have heard aright."

At this moment, Lady Thorndale entered the room, and presently Frank went. Never had Margaret longed for evening to come as she longed that afternoon, that she might be alone and have leisure to think.

Little sleep had Margaret Desmond that night. Her mind was a chaos of confused doubts and perplexed questionings. Again and again one question put itself before her with wearying persistency: Could it be possible that her father was still alive? She had long ago come to the conclusion that his appearance to her in the dead of night in her chamber at Larch Cottage was nothing more than the hallucination of an over-excited brain; but after what she had been told to-day, she could not help asking herself whether it might not in very truth have been her father himself whom she saw, and no mere figment of the imagination. But the more she thought over all that Frank Avory had told her, the more perplexed and confused she became. On one point only it seemed to her that her duty was clear: she must go to Dieppe and seek out Mrs Desmond, and demand from her so much of explanation as would satisfy Mr Avory with regard to his uncle's fate. Nothing less was due to him, after the discoveries he had already made; and if she could not obtain such an explanation for him, there was little doubt but he would seek it for himself.

The very fact of having decided on a definite course of action brought some comfort to her mind. As soon as breakfast was over, she sought five minutes' private interview with Lady Thorndale; after which she sat down and penned a brief note to Frank Avory, telling him where she was going, and what was the object she had in view.

Twenty-four hours later, Miss Desmond rang the bell of Madame Belot's boarding-house, No. 19 Rue de la Harpe, Dieppe. Two minutes later, she found herself in the presence of Madame Belot herself.

"Mademoiselle is probably a relative of Madame Desmond?" said the boarding-house keeper, as she glanced from Margaret's card to Margaret's face.

"I am Mrs Desmond's step-daughter. I have come all the way from London to see her. Is there any reason why I should not see her at once?"

"No reason at all, except that Madame Desmond is not here to be seen," answered Madame Belot drily. "It is now three days ago since Madame left the house, without saying a word to any one, and taking with her only a small hand-bag. She

has neither been seen nor heard of since. *C'est vraiment une affaire très mystérieuse.*

Margaret knew not what to say or do.

'Mademoiselle is probably well known to Madame Desmond's brother, Monsieur Ingram?' asked Madame Belot after a pause.

Margaret shook her head. 'I knew that Mrs Desmond had a brother residing in Dieppe; but I do not know him, nor did I ever hear his name before.'

'Monsieur Ingram is a charming gentleman—such manners!—but he is ill, very ill indeed. Still, if Mademoiselle would like to see him, Jeanne shall take up her card.'

There could be no harm, Margaret thought, in her seeing this Mr Ingram, providing he were not too ill to receive her. Information of some sort he might perhaps be able and willing to afford her. So Jeanne took her card up; and presently came back to say that Monsieur would see Mademoiselle Desmond.

Margaret was ushered into a large sitting-room with three windows, the blinds of which were let down, to exclude the glaring sunlight. For a moment or two, Margaret could discern little in the semi-obscurity of the room. Then she was aware of the figure of a man stretched on a couch at one end of the room. The figure rose on its elbow as she stood hesitating in the middle of the floor. 'Madge!'

A low inarticulate cry burst from her lips; she staggered a step or two forward, and then fell senseless to the ground.

(To be concluded next week.)

## INDIA IN THE HOT WEATHER.

BY AN ANGLO-INDIAN.

'GIVE a dog a bad name, and hang him,' says the proverb; and I fear that its spirit has been, and is applied to India; for no country has been more unjustly maligned as regards its climate; and the 'bad name' ascribed to it on this score by the ignorant has more or less contributed to the evil reputation under which the country still labours. The shadow of yellow-fever hangs over the West Indies; that of malarious-intermittent darkens the west coast of Africa; while cholera broods in malignant persistence over the hills, valleys, and plains of Hindustan, this much-maligned land. This is the popular idea; against which it will be useless to urge that cholera is relatively less fatal out here than typhus or consumption at home. Yet such is the fact. All the complaints against the Indian climate merge in a vulgar howl against the hot weather; and few will believe me when I maintain that it is not the climate which kills, but the foolish and mad habits of those who are exposed to it. After an experience of twenty-eight years, I assert this fearlessly and truthfully; and maintain that if we take ordinary care of ourselves, the country will take very good care of us.

Let me illustrate what I mean. As a rule, 'the hot weather' in the Bengal Presidency—to which these remarks mainly apply—commences normally about the fifteenth of March, and extends to the middle of June, when 'the rains' set in, refreshing the thirsty soil, and cooling the air. Their influence extends well into October, and then the 'cold weather' ushers in a truly enjoyable climate. From the middle of March to the middle of June,

'the hot wind' blows steadily, and at times fiercely, parching up everything with its fiery breath. But the fiercer and hotter it blows, the greater, as I will presently show, are our facilities for keeping ourselves cool. During the hot weather, Nature seeks repose; all animals share in it as much as possible; birds and beasts seek the shade of trees, and all labour is suspended between ten A.M. and five P.M. Yet at this time we think it necessary to take the most violent exercise. In the month of May, when the heat rages most fiercely, we deem it our duty to go tiger-shooting, because then, owing to the heat, these felines are less given to wandering. During the same month, and all through the hot weather, we also deem it our duty to take the most violent exercise to be had anywhere, and that is in the racket courts, which, perversely, are chiefly frequented in the hot weather.

Not only do we show our folly in thus taking violent exercise during the season of Nature's repose, but we redouble the folly by counteracting the fatigue and violent perspiration with iced 'pegs'—one and a half to two ounces of brandy or whisky in a bottle of soda-water—or large draughts of iced beer, and then getting under the punkah to cool down. No wonder, then, that malarious fever, dysentery, or abscess of the liver, reward our longings for violent exercise in the jungle, racket court, or polo ground.

How, then, do rational people pass the hot weather? Outdoor work is generally got over between daybreak and eight or nine A.M., and then we are prisoners till five or six P.M., having to while away eight or nine hours in keeping the body cool and the mind employed. Our cooling appliances are the tattie, the punkah, and the thermantidote, which I shall individually describe.

The tattie is a large curved or sloping screen, which accurately fits into each door or window facing the west, and is made of the roots of the khush-khush grass (*Andropogon muricatus*), which singularly combines strength and porosity with the most delicious and refreshing fragrance. These screens are about an inch in thickness, and during the hot and dry west wind, are saturated from outside with water, which immediately commences evaporating under the fierceness of the blast; and as evaporation always implies cold, the wind, which, in the veranda, would raise the thermometer to one hundred and twenty degrees Fahrenheit, passes into the house at seventy-five or eighty degrees, laden with a delicious fragrance. While tatties are in working order, all other cooling appliances are unnecessary. Unfortunately, the west wind, commencing about ten A.M., dies away about sunset, and then we resort to our punkahs and thermantidotes; but at its acme in May, it often blows all night, and then we have cold days and nights within doors. The dryness of the west wind is very remarkable; its scorching influence at once detects veneer, which crumples up and peels off; unseasoned woods warp, split, or contract, so much so, that I have seen two solid slabs of a round table part nearly an inch during the west wind, and rejoin during the damp of the rains; the boards of books turn outwards, and the ink of your pen dries as you write. The west wind is also highly electrical; insulate yourself on a couple of bottles, and then comb your hair or beard

with an ebonite comb, and a by-stander will easily elicit a spark from your knuckle. If you perform in the dark, and glance at the mirror, you will see your hair and beard alive with sparks. When your horse comes up for your ride, you will be astonished to see each hair of his tail erect; pass your hand down it, and it falls flat. In some parts of India—for instance, in the neighbourhood of Gwalior and Jhansi—we have another delightful form of tattie. A small creeping thorny variety of the *bér* (*Zizyphus jujuba*) is largely found in the jungles; this is collected and dried; and at the proper time, the whole west veranda is inclosed with thorny walls nine to twelve inches thick, and these being saturated from outside, all doors are thrown open, and a delightful temperature secured. Tatties are of no use during the easterly wind which ushers in and accompanies the rains. Laden with moisture, it is a damp wind, and therefore retards evaporation.

Thus much for tatties. Punkahs are more familiar, and consist either of long rectangular frames, or beams hanging from the ceiling of the rooms, their lower edge furnished with heavy frills; the punkah rope is pulled by a punkah-wallah from the veranda outside the house, and the machine waves noiselessly to and fro. Then we have hand-punkahs or large fans, which may be made of cloth, of *klus-klus*, moistened when used; or we may adopt the familiar dried leaf of the fan-palm (*Barassus flabelliformis*). Punkahs have no effect whatever in actually cooling the air of the rooms; they merely set the air in motion, and thereby cool the person by promoting evaporation from the skin.

The thermantidote is a great institution, and is merely an exaggerated form of what I recollect as the Cambridge bellows, a small edition of a furnace-blast. The fans are generally from three to four feet in diameter, and are worked by a fly-wheel with an endless band; the air apertures on each side of the fans are closed by *klus-klus* tatties, so that cold air passes inwards; and if the machine is carefully constructed and properly worked, a prodigious volume of cold air is pumped into the house; and if its inner doors are judiciously closed, the cool air will penetrate every nook and corner of the house.

Thus much about our appliances for keeping the body cool during the hot weather. How do we mentally relieve its tedium? I fear I must confess that in the majority of instances we while away the weary hours in smoking, drinking iced 'pegs,' reading the latest novels, card or billiard playing, or sleeping. The males in the minority employ their time in reading, writing, or studying the language; not a few have made themselves famous as archaeologists, numismatists, geologists, or natural historians. Their ladies, on the other hand, have ample employment in looking after their nurseries and households, devoting their leisure hours to music, correspondence, and self-improvement. Writing in the hot weather is a sore trouble, for our greatest enemy is then the punkah, against which we have to wage constant and vigilant warfare, our weapons being letter-weights or shot-bags. You are writing, say, the four and a half sheets of thin paper which constitute your weekly home despatch, and are suddenly called away from your desk. The punkah insidiously sent you that call; and when you

return, you find your sheets careering about the room, and the punkah creaking its satisfaction at the joke, and at having got the better of the letter-weights, which, in your hurry, you forgot to adjust. Or you may be writing at night with all your weighting appliances in order, and your kerosine lamp, punkah-proof as you fancy, burning brightly on your table. Foiled in its attempt on the latter, the punkah fiend minutely overhauls your lamp, and rejoicingly finding a weak point, leaves you suddenly in darkness. But a little forethought enables you easily to overreach the punkah, and you can read and write in comparative comfort.

The long day at last draws to a close; the shadows lengthen eastward, and the jubilation of the crows and mynas announces the approach of evening; all doors, hermetically sealed since the morning, are thrown open, and we prepare to go forth. The lunatics troop off to the racket court; sane individuals betake themselves to riding or driving, repairing to the band-stand or to some *al fresco* 'at-home,' where Badminton or Lawn-tennis, winding up with a dance, constitute the attractions, croquet having been quite banished. All wend homewards by seven or half-past seven P.M.; dinner is discussed; perhaps music, reading, or card-playing follow for an hour; and then by nine or ten all have retired, or are supposed to have retired to their slumbers.

And so weeks and months pass, and the approach of June is hailed as sure to usher in 'the rains.' But a trying ordeal is still to be undergone in facing the interval between the two winds which are termed monsoons; the north-easterly one dies away towards the end of May, and the south-westerly does not set in until about the middle of June. The interval is a most trying atmospheric lull, and we are entirely dependent on the punkah or thermantidote, or both.

It must not, however, be supposed that the hot weather is accompanied throughout by heat unmitigated and intense. I will briefly indicate its thermometric features, say at a central position like Allahabad. In January, the indoor temperature will reach its minimum, perhaps standing at fifty-four degrees; the rise is very gradual, and gets into the 'eighties' towards the middle of March; when steady at eighty-five degrees, punkahs become necessary. Above ninety degrees, the heat is oppressive; and at ninety-five, horribly so; this is generally the temperature indoors during the lull between the monsoons. In exceptional years, I have known pillows and sheets to be uncomfortably hot, requiring sprinkling with water; and I have similarly retired to rest in drenched night-clothes. But the hot weather is mercifully interrupted by two remarkable meteorological phenomena. First, at its commencement we have almost always violent hailstorms, which beneficially cool the air; and then at its acme, we have those very remarkable electrical dust-storms which impress fresh life and vigour all around. Let me describe one.

Nature seems subdued under the great heat, and is in absolute repose. Not the faintest breath is there to coax the faintest movement in the leaves; silence prevails, for even the garrulous crows can't caw because their beaks are wide open to assist respiration. Suddenly the welcome cry is heard

'Tufán áttá!' (A storm coming!), and the house-servants rush in to close all doors. Anxious to witness the magnificence of the approaching storm, you remain out to bravó it, and soon feel its approaching breath on your cheek. Looking to windward, you see a black cloud approaching, and before it, leaves and sticks, kites and crows, circling in wild confusion. You now hear its roar, and, while rapt in admiration, you are enveloped in its grimy mantle, and have to look to your footing in resisting its fury; and this is no joke, for eyes, nostrils, and ears are occluded with dust. As the blast approaches, you may see a flash of lightning and hear its clap of thunder, and then feel the heavy cold rain-drops which sparsely fall around. Darkness, black as Erebus, surrounds you, darkness which literally may be felt, for clouds of dust occasion it; and if you are within doors, night prevails, requiring the lighting of lamps. The storm passes, light returns, and you find everything begrimed with dust. Every door is now thrown open, to admit the cool, bracing, ozone-charged air, which you eagerly inhale with dilated nostrils, and feel that you have secured a fresh lease of existence.

Such are the main features of our up-country hot weather; but they are greatly modified by latitude and elevation. Thus, in Calcutta you miss the hot wind, have more thunderstorms, and enjoy to the full the delicious sea-breeze, which generally sets in about sunset and lasts all night.

Then the stations on the high table-lands of Central India have, as a rule, diminished temperature and refreshing night-breezes. Taking all things into consideration, the ten to fifteen days of awful lull between the monsoons are the most trying portion of our hot weather; and I hope I have shown that in this respect, India, all round, is not so black as she has been painted.

#### SCHOOL-HOURS IN ENGLAND, FRANCE, AND GERMANY.

In the *Journal of Education* for September there is an elaborate table, showing the number of hours given to various studies in eighteen leading public schools in England, to which are added the timetable of a German gymnasium and that of a French lycée. From the data thus collected, it is found that the average number of hours per week in an English public school is about twenty-six, as against thirty-one in a German gymnasium, and forty in a French lycée. Reckoning the hours spent in the preparation of lessons, and taking into account the holidays (which in England are twice as long as they are on the continent), it is found that the respective working hours of an English, German, and French boy are in the ratio of five, eight, and eleven. That is, the English boy each day works one-third less time than the German, and less than one-half the time of a French boy. As to the subjects taught, while science is not now altogether ignored in English schools, yet classics still form in these seminaries the staple of the education given. An English schoolboy gives fourteen hours a week, or more than half his time, to classics; a French lycée scholar devotes twenty-eight hours a week, for his first three years, to his native tongue, and does not begin Latin till the second period, or Greek till the third period—that is, till he has been six years at school.

In this connection, it may be of interest to quote the following passage in the recent address by Sir John Lubbock, Bart., M.P., as President of the British Association. Reviewing the progress of science and arts for the last fifty years, he went on to say: 'In Education, some progress has been made towards a more rational system. When I was at a public school, neither science, modern languages, nor arithmetic formed any part of the school system. This is now happily changed. Much, however, still remains to be done. Too little time is still devoted to French and German, and it is much to be regretted that even in some of our best schools, they are taught as dead languages. Lastly, with few exceptions, only one or two hours, on an average, are devoted to science. We have, I am sure, none of us any desire to exclude or discourage literature. What we ask is that, say, six hours a week each should be devoted to mathematics, modern languages, and science—an arrangement which would still leave twenty hours for Latin and Greek. I admit the difficulties which schoolmasters have to contend with; nevertheless, when we consider what science has done and is doing for us, we cannot but consider that our present system of education is, in the words of the Duke of Devonshire's Commission, little less than a national misfortune.'

#### WANTED.

Like unto ghosts that come when darkness broods  
O'er tower and turret of some castle hoary,  
And people once again its solitudes  
With shades of vanished glory;

From out the haunted chambers of our hearts,  
Where all the lost things of the Past lie hidden,  
Some subtle incense will, as day departs,  
Steal softly forth unbidden.

Incense from off the altar of dead dreams,  
Whereon new hopes to higher heights have risen,  
And calmly shining, shed down milder beams,  
To gild this earthly prison.

But still a mournful sweetness hovers round  
These mystic phantoms from the heart's recesses;  
The tender touch of lips that yield no sound—  
The sheen of silken tresses;

The nameless tokens of the dear dead days,  
The twilight trystes by moonlit waters smiling,  
The golden sunsets wrapt in dreamy haze,  
The spell of Love's beguiling;

The rapture of a summer long ago,  
The song that came and went in broken numbers,  
The holy hush of Death, the brow of snow,  
The churchyard where she slumbers;

The tender pressure of a vanished hand,  
The broken chain that time must further sever,  
The merry laughter of the childish band,  
The voices hushed for ever.

'Strains of sad music from a far-off shore—  
Mute memories these that woo with soft caresses,  
And tinge with sacred radiance evermore  
Life's lonely wildernesses.

## THE BATTLE OF LIFE.

IF life be a battle, as in some sense it generally is, it is plain that the young should have a reasonable preparation for the contest. The necessity for this is fully recognised in the widespread course of elementary education, now happily established as a matter of legal compulsion in this country; and is scarcely less recognised in the secondary or higher branches of instruction; but here comes in the unpleasant fact that much of this superior kind of learning is little better than thrown away. It is too obvious, from various indications, that far too many youths on whom a costly education has been lavished live in idleness, and in ordinary phrase are good for nothing. Neither able to work nor want, and pampered by indulgence, they in reality demonstrate a hearty contempt of honest industrial pursuits, and enjoy existence as mere consumers of food and clothing, provided, less or more grudgingly, by relatives. There they are in hundreds, lounging in club-rooms and watering-places, and encumbering the public thoroughfares—a bad example everywhere. For these young swells, the battle of life has to be fought by deputy.

It is customary for distinguished statesmen, when appointed to the rectorship of universities, to deliver eloquent orations to the assembled students on the prodigious importance of storing their minds with learning for learning's sake. That, in different forms, is the burden of their song. The students addressed are to have no practical object in view. To take in an enormous stock of classical languages and mathematics, and so attain a high position in scholarship, is what is expected of them. They are warned against anything like trying to think about getting on in the world; that is beneath their notice. Exalted learning alone deserves ambitious consideration. We have sometimes thought that these high-flown recommendations of learning in the abstract are not only carried a little too far, but are pretty much of a sham. Anyway, they can

scarcely fail to be injurious. To tell a parcel of lads in this *ex-cathedra* fashion, that learning will be its own reward, without a hint as to what is to be the practical issue, is apt to lead them very much astray.

Erudition is of course to be valued in connection with the learned professions. We are likewise aware that the routine of education at Eton, Rugby, and other public schools of a high order, finishing off with degrees at Oxford or Cambridge, has the merit of cultivating on a large scale a singularly polished element in society. To this source we habitually trace some of the greatest lawyers and men of science, to say nothing of dignitaries in the church. Unfortunately, there are dark sides to the picture. How many men can boastingly say: 'I am an M.A. of Cambridge;' and yet possess so small a share of common-sense or worldly wisdom, as to be spoiled for all good purposes. The redundancy of high-class scholars is, however, most conspicuous in the number of genteel idlers to whom we have called attention. Unqualified to perform any useful work, the difficulty is to know what to do with them. Their polish is a positive drawback. The world has much coarse business to do—ploughing and delving and hammering, for example—not suited to those who are unaccustomed to hand-labour, or indeed, to labour of any kind. In short, society is getting plagued with the superfluity of youths who seem as if educated to do nothing. They may be able to tell from their classical lore all about the Argonauts who sailed from Colchis in search of the golden fleece. But elegant myths of this description are not in the least wanted in the affairs of ordinary life, and do little in the way of mental culture. No one cares about the Argonauts. That which would be greatly preferred would be some useful knowledge in science and history bearing on every-day concerns. The ignorance prevailing even in high quarters on the subject of political economy is something pitiable; nor is it less melancholy to see how little is known of the history of times comparatively recent.

In the course of a public address lately delivered in London on University teaching, Mr Goschen pointedly refers to the study of History, English Literature, and Political Economy as a means of strengthening the mind, preparatory to taking a share in the active duties of life. A knowledge of modern languages is also not on any account to be neglected. The educator, we think, has especially to consider what will sharpen the mental faculties, with a view to habitual foresight in the difficulties and emergencies that are apt to crop up in almost every one's experience. The necessity for promptitude of action occurs in a hundred ways in ordinary life. It is demonstrated on the battlefield, in the duty of the seaman, in the business of the merchant, and in the exacting work of the locomotive driver and signalman. The world is getting terribly in want of men who can not only reason correctly, but act with decisive promptitude. The dreamy indifference of the fashionable Lord Dunsinore type may pass muster within the realms of Swellclough; but even there, we suspect, in this exacting age of bustle and scientific discovery, it must be losing its old wonted ground.

There are cogent reasons for believing that the number of youths devoted to a high-class education for ceremonial purposes, will in no long time suffer considerable diminution. Society seems destined to lose a certain amount of its polish, owing to the operation of causes as inevitable as the power of gravitation. The rent of land has considerably fallen, and will, to all appearance, continue to fall. Land-proprietors are already beginning to feel the pinch. Their revenue is declining; and their sons, instead of being brought up to do nothing, or to rely on appointments which cannot now be obtained, will be forced to abjure idleness, and betake themselves to pursuits inconsistent with the elegant repose of a Cantab. It would not surprise us to hear of them becoming farmers on the patrimonial acres, or seeking homes in the Far West, where they would perhaps be less ashamed to be seen cultivating the soil for a subsistence. To accommodate young and accomplished scholars, who are driven to adopt this latter expedient, a gentleman of letters, Mr Hughes, has kindly devised a scheme for settling on a tract of land, designated Rugby, in the state of Tennessee. There, farming is to be conducted on a scale so tasteful as to give no sort of offence. At any rate, should there be any sense of humiliation, all will be humiliated alike. There are rumours of prospective failure, owing to an imperfection in the soil; but perhaps it is too soon to say how this fanciful project will succeed. We hope it will have a fair trial. The object has in view a means of working up a material now running to waste, and that in itself is an important economical consideration.

The circumstance of being obliged to find an outlet for highly educated gentility in a western wilderness, in itself proves that a great mistake

has been committed by many parents in the method of preparing their sons for a course of useful exertion. The error comprehends not only a waste of money, but a waste of brain, along with the infliction of life-long regrets, and it may be much acute misery. If youths are to be sent to try their luck in Australia, New Zealand, or in the unsettled parts of America, let them, at least, be prepared accordingly for what they have to encounter, and not be bred up with refined expectations, habits, and tastes incompatible with the rough struggle for existence in a new country. Independently, however, of any such prospective struggle, it is evident that for home use, the market is glutted with youths, whose education of a so-called high class has unfitted them for any but a limited range of occupation.

In these remarks, we have only glanced at a vastly important subject, which, we trust, may soon engage the attention of educationists. The curriculum of school-learning in the secondary departments needs a distinct revision, to bring it into harmony with modern requirements—in short, to prepare youth more effectually for the battle of Life.

W. C.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER LII.—HOW THE TRIAL ENDED.

THE examination of a few more witnesses came first. Their evidence was needful, perhaps, but not exciting. To Bertram Oakley, the counsel for the defence showed marked courtesy. He told what little he knew, as he would have told it at the bar of heaven, as simply, and well. The prisoner never once looked at him. Many curious eyes in court noted that.

'We have no questions to ask of you, Mr Oakley!' said the learned serjeant, with a bow, as Bertram stepped down.

Then came the turn of the defence. There were witnesses to be called. Nobody, of course, can prove a negative; but an imposing array of witnesses to character might, it was thought, weigh with the jury. It does not do to let juries imagine that all the proof is on one side. Serjeant Silver-tongue had hesitated long, it was whispered among the barristers present, as to whether to call no witnesses, and let the Attorney-general have no second innings; or to adduce testimony, and let Sir Richard have his right of reply to the grand speech that was yet to be spoken. It had been thought best to call the witnesses.

Old Lord Haverstock was the first called. He stared, in bovine fashion, from behind his stiff cravat, at judges, counsel, and audience. Had met Mr Denham at Naples. Was not quite sure whether their acquaintance had not begun, two years before, at Geneva. Had introduced Mr Denham to his family. Had the highest, that is to say, an excellent opinion of Mr Denham. Mr Denham and he were both fond of pictures. The prisoner had dined with him, both at Haverstock House and abroad. Thought that he had accepted the prisoner's hospitality, but was not quite sure, at the Caffè del' Europa at Naples.

'In fact, Lord Haverstock,' said Sir Richard,

who rose to cross-examine, 'your evidence comes to this. You have dined with Mr Denham; you have chatted about pictures in his company, and you know no harm of him. Is not that a fair summary?'

Old Lord Haverstock retired, apoplectic and malcontent; and then a Lord George Chatterley, Under-Secretary for the Income Tax Department, took his place. Lord George had a good deal to say for himself. He had something to say, too, for the prisoner. In his eyes, Mr Walter Denham was a harmless, well-meaning man, who would not hurt a fly. 'Touchy, I daresay, about Art, but a person I have a sincere regard for,' he said in conclusion. A Bishop, a wealthy merchant, Prince Galitzin from the Russian Embassy, and M. Bossu, the French Secretary of Legation, declared, in varying language, that Uncle Walter was a *parfait homme d'honneur*, a man of sound principles, a worthy man, *un homme de bonne compagnie*; and there was an end of Mr Denham's praises.

Then Mr Serjeant Silvertongue rose, and a little flutter of anticipation ran through the closely wedged audience; and Sir Richard Sharpe himself, who cared no more for speeches than did the judges themselves, half-closed his eyes and waited, sardonically, to hear how his rival would transmute the wrong into the right.

The Serjeant did not make a good, or at any rate a grand beginning. In low, sad, tremulous tones, he bewailed the heavy weight of circumstantial evidence that pressed upon his client—his innocent client, as he trusted to prove—that circumstantial evidence that has hanged so many guiltless men, in the hard old days when the shadows of the gallows darkened every humble British hearth and home. Then he proceeded to pay an elaborate compliment to the jury, to their independence, their probity, their sense, that Anglo-Saxon mother-wit of theirs, which caused them to scent out the truth, even when great orators and potent functionaries misused their talents to drive, huddle, and hustle juries into a foregone conclusion. He drew quite a fancy portrait of Uncle Walter, as of a man careless, charming, generous, no one's enemy but his own, a child-like, frank-souled creature, scarcely realising the magnitude of the iniquity attributed to him. Would they break a butterfly on the wheel? What was against his client? The testimony of a miscreant like 'Crawley—'Julius' Crawley; and the deposition of Crawley's reckless accomplice, Nathaniel Lee. And Serjeant Silvertongue asked if any jurymen could ever hope to enjoy a sound night's rest again, or to be happy in the bosom of his family, unless he righted this calumniated man.

It was a fine forensic effort; but for all the good it did, Mr Serjeant Silvertongue—who may or may not have been a lineal descendant of his namesake immortalised by Hogarth—might as well have let off fireworks in court.

The Attorney-general smiled as he rose to reply. Sir Richard did not speak long. He tore to pieces in five minutes the flimsy sophistries of his opponent; in five more, he had said all that was to be said concerning the value of the evidence to character, and had called upon the jury to do their duty.

The summing-up came next. The charge of

the judge was adverse to the defence. The jury retired.

'I give them twenty minutes,' said an expert, pulling out his watch. In fifteen minutes they were back in their box.

'Guilty, my lord,' announced the foreman.

'What have you to say, prisoner?' asked the senior judge, fluttering over the pages of his notebook, before sentence was pronounced.

Mr Walter Denham was on his feet, leaning lightly and in an elegant attitude on the rail of the dock. His handkerchief was in his white hand, on which jewels glistened. Twice, he bowed, with formal deference, to the Bench. Then he bent his head, and hid his face in the soft cambric, as though overcome by emotion. There was a moment's pause of expectation; another, and then Uncle Walter slipped, or slid, away from his erect position, and dropped, a huddled heap, upon the floor. There was an outcry, a stir, a trampling of heavy feet, and an exclamation, 'Poison!'—'A doctor!'—'He is dead!' And then the confusion, the babble of tongues, the shrill feminine screams, the pushing and the turmoil, made a bear-garden of the court of justice.

A doctor was soon found—one, two, three doctors. Where there is a crowd, a man of healing is seldom far to seek. But when the surgeons were admitted into the narrow pen of a place, crowded by tipstaves and police and irrepresible sightseers, they could do nothing to keep a spark of life in the heavy, languid head and limp body of what had lately been Walter Denham. The prisoner had kept, unsuspected, in the hollow of a great signet-ring, cunningly constructed by Italian goldsmiths, a few grains of the only poison powerful enough to slay at an instant's warning; and now shame and punishment and reproof from mortal lips were all too late for Uncle Walter!

(To be concluded next month.)

## CURIOUS FACTS RELATING TO GUNSHOT WOUNDS.

BY A SURGEON.

THE treatment of gunshot wounds and contusions has been resolved into a distinct branch of surgery, of more importance necessarily to the military than the civil practitioner of that art, yet not without interest to the latter, seeing that every form of the injury which is common on the battlefield may occasionally crop up in the routine of every-day practice. Under this heading, too, may practically be included every accident resulting from projectiles, however propelled, such as those which follow gas, steam, or chemical explosions; and the secondary injuries, so to speak, inflicted by splinters of metal, wood, or stone, torn up by the passage of a ball, or in blasting and mining operations, by fragments of clothing or other extraneous matter driven in, and by sharp-pointed pieces of fractured bones dispersed among important tissues by the force of the concussion.

Injury supposed to be received by the *wind* of a passing bullet—about which we used to hear so much—is now shown to be a fallacy, and the disastrous results attributed to it in certain cases were probably due to causes which we shall presently note. Formerly, too, the great inflam-

mation which invariably occurs in the track of a bullet-wound, was ascribed to burning of the parts, to the poisonous nature of the projectile, or to electricity developed by the bullet by its friction against the barrel or in its passage through the air; but the later military surgeons have demonstrated that it is due simply to the bruising inevitable in a deep wound inflicted by a blunt object. Weapons charged with powder only, may be productive of serious mischief. A pistol with nothing but a pinch of powder in it has been known to kill a man by concussion of the heart, having been discharged with the muzzle resting against his chest; and Dupuytren relates a case where a man fell, pierced with a round hole, when fired at with a fowling-piece charged with powder only, at a distance of a few feet. Would-be suicides often forget or intentionally neglect to put a ball into the pistol, but lacerate themselves extensively, and sometimes fatally, by discharging it into their mouths. Sometimes a portion of the unexploded powder may be driven into the flesh by that which is exploded behind it; and, if nothing worse ensues, great disfigurement is thus produced by the tattooing of the charcoal. The wadding of a gun or blunderbuss, fired only for the effect of the explosion, has occasionally been known to kill on the stage or at reviews.

Marvellously fortunate escapes from gunshot injuries have been recorded. Bullets have been known to rebound or glance off the skin, leaving only a dent, probably from the oblique direction in which they struck; a spent ball strikes a rib and drops out again, or carries in a portion of clothing before it, rendering it easy to withdraw. Sir Astley Cooper relates two extraordinary instances, in one of which a bullet moving with full velocity entered the side, and coming in contact with a rib, was deflected out of its course, and ran round under the skin to the opposite side of the body. In the other, the bullet struck one temple, passed over the head under the scalp to the other, and never penetrated the skull at all.

The following case occurred in the practice of an eminent surgeon, whose pupil I was. A man was brought to him who had shot himself in the side of the head with a pistol, with suicidal intent. He was said to have held the weapon only an inch or two from his ear, and the extensive burning and laceration of the skin bore evidence to the truth of this statement; there was a ragged bullet-hole; nevertheless, no fracture of the bone could be detected, and there was an entire absence of 'head symptoms'—that is, those indications which point to some lesion of the brain. So he was put to bed and kept quiet, without any treatment at all beyond simple local applications, carefully watched the while for any untoward manifestations that might develop themselves. But nothing came of it, and in a week or two the man was nearly well. Then, for the first time, he complained of a pain and stiffness in the cheek, which, being examined, showed signs of an impending abscess. This formed and was opened in due course, when out dropped the bullet! Now, how was this to be accounted for? At the side of the head is an arch of bone, known technically as the *zygoma*; it may be seen in the skulls of animals, and serves to protect and strengthen the hinge of the jaw, as it were. The bullet, meeting the sharp upper edge of this arch—there was a

mark on the bullet caused probably by the bone—was turned suddenly downwards at right angles, and lodged in the thick muscles of the upper part of the cheek. But this would never have occurred if a great disproportion had not existed between the calibre of the pistol-barrel—an old-fashioned cavalry blunderbuss—and the size of the ball, which allowed much of the powder's force to be expended around it.

It is a well-known fact that bullets, coins, and other metallic objects will occasionally remain impacted in the flesh for years, without giving rise to any irritation or annoyance. In a case which came under my notice in London several years since, a ball had undoubtedly passed into the chest, and is undoubtedly there to this day; yet the patient recovered without any bad symptoms, and is still alive and well.

Two German students, being in love, or in debt, but in any case in despair and wearied of the world, agreed to put an end to their troubles by shooting each other through the heart simultaneously. So much was gathered from a paper signed by both of them, found on their table when the police, alarmed by the double explosion, broke into the room where they lay on the floor, weltering in their blood, one a corpse and the other desperately wounded. But when the latter had recovered sufficiently to speak, he emphatically denied the truth of the allegation that he had murdered his comrade, and stated that though he had signed the paper he had repented of his determination at the last moment; not so his friend, however, who seizing both pistols, had shot him in the breast, and killed himself afterwards. A verdict of wilful murder was returned against him by a coroner's jury; but when he was put upon his trial, after a long and dangerous illness, he was allowed the benefit of the doubt—a decision at which no one will cavil much.

Hennen states that he has seen five cases in which bullets were lodged within the skull and did not prove immediately fatal; Cunningham speaks of a boy who survived for twenty-four days with the breech of a pistol, weighing nine drachms, in his head, lying on one of the membranes of the brain, and resting against the concavity of the occiput; while Dr O'Callaghan has recorded the remarkable case of an officer who lived seven years with the breech of a fowling-piece—three ounces in weight—lodged in his forehead, and actually supporting the right hemisphere of the brain!

Nevertheless, such instances are rare; and it must not be supposed that an impacted bullet—such as that which carried off the late lamented President of the United States—will not set up serious mischief in the vast majority of cases, or that even if it does not cause irritation at first, that it can be allowed to remain in the body with impunity. Military surgeons of the present day are unanimous in their opinion that it should always be extracted without delay; for, as Dr Macleod observes, not only may this operation afterwards become a matter of increased difficulty, owing to swelling and inflammation; but the fact of its extraction removes a source of mental disquietude as well as physical suffering, and the mind of the patient becomes more tranquil and easy. A foreign body of this nature may take on a serious or fatal action after remaining

quiescent for years. A soldier died in University College Hospital two years and a half after he was shot in the chest; and it was found that the ball had actually traversed the body, wounding the lung, kidney, and other important organs, and had finally perforated the spine and lodged there. Liston removed a similar missile from General Ben's hip after it had lain there nineteen years; and Marshal Mancey, it has been alleged, died from the effects of a gunshot wound forty years after its reception.

To discover a bullet in a deep wound is sometimes no easy matter; though the locality may be now pretty nearly ascertained by means of the induction balance of Professor Hughes. The instrument devised by Nelaton, by means of which he discovered the ball deeply situated in Garibaldi's foot, is a striking instance of the application of a collateral science in skilful hands—and what sciences are not collateral to surgery and medicine? It consisted of a simple probe, tipped with rough unglazed porcelain; this was passed down to the site of the suspected bullet and twirled about. When examined, the porcelain was found to be covered with dark streaks, and these being scraped off and submitted to delicate chemical analysis, were proved to consist of lead. The presence of the bullet was thus established beyond all doubt. Wonderfully ingenious as it is, it is possible to conceive two opposite combinations of circumstances under which this device might fail—where the ball lies beneath a shield of soft tissues or coagulated blood which would prevent the communication of the characteristic leaden stain, and where it has already fallen out, but has left marked some projecting point of bone from which the probe might receive enough to determine the existence of metal.

The direction from which the projectile has been received and in which it traverses the injured part, is a matter of great importance. As a rule, it forms two openings, one of entry and one of exit, the former being distinguishable from the latter by its small, circular, depressed, and generally clean appearance; while the exit aperture is larger, irregular in outline, and everted. This is especially seen in wounds which have caused double perforation of the skull, and depends, as might be expected, on the lessened momentum of the ball, owing to the resistance it meets with on its passage through. It is a curious fact that the aperture of entry will almost always be found to be smaller than the bullet itself; but the same thing is seen when a piece of green timber or any elastic material is struck. A single bullet has been known to produce six wounds in the same person, passing through one hand and both thighs; and more than one case is on record where the ball has split in halves against the sharp edge of the shin-bone, leaving thus one aperture of entry with two of exit. The modern conico-cylindrical bullet, in connection with the rifled firearms now in use, is the most destructive missile ever invented, tearing its way through the densest structures, splitting up the shafts of bones by its wedge-like action, and so spreading its effect in every direction beyond the actual spot it strikes, and not liable to be deflected from its straight course by any resistance of the tissues. Veins, arteries and tendons, by virtue of their elasticity and slippery nature, would glide aside from the

old round musket-ball, which often passed between such important structures without damaging them, or was even turned in another direction by their elastic reaction. In fact, the introduction of these conical projectiles into warfare has of late years altered the whole system of military surgery, since gunshot wounds are a much more serious affair now than formerly, and treatment which was generally adopted for injuries in certain situations has now to be abandoned for measures more prompt and active, less conservative, and attended with a smaller prospect of saving life.

That indefinable depression of the vital powers known as 'shock,' which follows a severe accident—though not always immediately—is much greater with these conical bullets than with the round ones. The direction of the wound is often a point of considerable interest in the legal aspects of a case. Sir Astley Cooper, by careful examination of the apertures of entry and exit in a murdered man, ascertained that the fatal shot must have been fired by a left-handed man; and this led to the detection of the criminal!

Cannon-balls occasionally inflict the most extraordinary injuries. A spent ball, or one striking obliquely or rolling over the surface of the body, will sometimes bruise without breaking the skin, which is preserved by its elasticity, while the parts beneath—bones, muscles, vessels, the internal organs, and even the spine itself—may be shattered and crushed to a pulp. These were the accidents which, as we have already stated, were formerly termed 'wind contusions,' and were supposed to occur without direct contact with the projectile, but by the action of the current of air which it set in motion.

Terrible wounds are not attended with such pain as might be expected at the moment of their reception, the excitement of the battle overpowering all feeling for the time. Thus it often happens that a soldier is wounded even mortally in the heat of action without knowing it until he sees or feels the blood trickling; Hennen states that he has seen limbs smashed or carried clean away by cannon-shot, without the sufferer being conscious of the hurt; and Macleod narrates that an officer in the Crimea 'had both his legs carried off, and was not aware of the injury he had received till he tried to rise.'

With regard to amputation and other operations after gunshot injuries, experience has shown that the sooner they are performed, the better is the patient's chance of ultimate recovery; and Wiseman's advice to 'cut off the limb quickly, while the soldier is heated and in mettle,' though discredited for a long time after his day, is now again the motto of military surgeons.

## CAPTAIN DESMOND'S DAUGHTER.

### CHAPTER IV.—CONCLUDED.

WHEN Margaret recovered consciousness, she found herself lying on the floor; but a sofa cushion had been placed under her head, and her father, kneeling on one knee, was bending over her and gently chafing one of her hands. Yes, her father, but woefully changed. She put out both her hands and clasped his, as if to assure herself of his reality. 'Papa?' she said questioningly, in a sort of awed whisper.

'Yes, darling; it is I—your poor, worthless, old scamp of a father.'

She rose to her feet and put her arms about him, and held him in a long embrace, while her heart seemed to choke with the sobs which she was powerless to repress.

As soon as she had grown somewhat calmer, Captain Desmond said: 'I am tired now, Margery. I want to sit down;' and looking at him more particularly, she seemed to realise for the first time how very ill he was, and what a wreck he had become since she had seen him last.

She led him to the couch, on which he sank down and shut his eyes. She knelt by his side, and held one of his hands in both of hers. Then she noticed another change which had struck her vaguely at the moment she set eyes on him, but which she had not been able to specify till now. The heavy military moustache which Captain Desmond had worn since his daughter could first remember him, was gone now. His face was clean shaven. It was strange what an unfamiliar expression so slight a change lent to features that she knew so well. Then again, his light-brown hair, which had been streaked with gray, was now dyed a dark brown, and betrayed no traces of age. He was the same man she had known and loved all her life; and yet he was different.

Presently, Captain Desmond opened his eyes, and carrying his daughter's hand to his lips, he kissed it. 'She has gone—she has left me,' he said in a low voice, with his eyes gazing straight into Margaret's. 'Yes, three days ago, without one word of warning. Excepting a little loose money in my purse, she has taken everything with her: about eight thousand pounds in all.'

To this Margaret could say nothing. 'I cannot think that she has gone alone,' added the sick man presently. 'But whether she has or not, she knows that I am far too ill to attempt any pursuit. I shall never see her again.'

Nothing more was said for a little while; then Captain Desmond spoke again. 'It is singular, Marge, that you should have hunted me up on the very day that I had written to you to come to me. See, there is the letter on the table, ready for the post. It may as well be burned now.'

'You ought to have telegraphed to me days ago as soon as you found yourself left alone.'

'Ah, what I ought to have done and what I have done, have been two opposite things with me all my life. But tell me what reason has brought you all the way to Dieppe so suddenly? But no; on second thoughts, you must be tired with your journey. You shall talk to me after dinner. Ring for Jeanne.'

Margaret was glad to get away from the room for a few minutes. Although the living man was there before her, she felt that as yet she could hardly realise it as a fact that her father was not in very truth dead and buried in the little churchyard by the sea. It seemed to her as if some great miracle had been wrought. What strange story would he have to tell her?

Captain Desmond's dinner consisted of a cup of

broth followed by some simple fruit; and Margaret, notwithstanding her long journey, had not much appetite. Her father seemed a little stronger and better in the evening, and touched, with something of his old airy, bantering way, on a score of different topics. To have listened to him, you would not have thought he had a care in the world; but then Captain Desmond had always had a happy knack of throwing off his cares; trouble had ever sat lightly on him; he was emphatically a man who lived for the present moment; yesterday was yesterday, and to-morrow could take care of itself.

'And now for this narrative, *carissima*,' said the Captain, as he sat paring an apricot in his easy-chair by the open window.

Then Margaret told her father in what way her acquaintance with Mr Avory had originated, of the questions he had put to her, and how his inquiries had led him step by step to the discovery at Mardon—or rather to Dr Bond's emphatic assertion that the likeness of Mr Freshfield was that of the man whose deathbed he had attended.

Captain Desmond listened attentively, not interrupting her by a word. When she had done, all that he said was: 'Poor old Caius!' in a half-regretful tone; after which he sat for some time gazing out of the window, but evidently seeing nothing, unless it were some half-forgotten pictures of the past. At last he aroused himself with a sigh. 'Yes,' he said, turning to Margaret, 'the man who died at Mardon-le-Willows on the fourth of April was Caius Freshfield, and not Marmaduke Desmond.' He played with the fruit-knife for a few moments; and then he went on: 'I suppose the only plan will be to tell you the affair from the beginning, although, mind you, the confession is not a pleasant one to make, and least of all to you, my dear, from whom much in my past career has been carefully hidden. To begin, then. Affairs with me had grown pretty well as desperate as they could be; all my speculations of late had failed; and I knew not which way to turn. The house at Mardon was little more than a hiding-place, a haven where I could take refuge in stress of weather. On the afternoon of the fourth of April, I was on my way to Mardon, when, while I was waiting at Rosethorpe Junction, a voice that I had not heard for nearly twenty years called me by name. I turned, and found myself face to face with my old schoolmate, Caius Freshfield. The meeting was a pleasant one for both of us. I had little difficulty in persuading him to accompany me to Mardon and stay till next day. He was an old bachelor, he told me, who lived in chambers by himself, and had no ties. He had been to a sale of books at York, and was on his way back to town, when we met. At Mardon, my wife made him welcome, and there was soon a cosy little dinner on the table. The woman, Elspeth Durham, waited upon us; for economical reasons, she was the only servant we had at that time. At table, poor Caius kept on prattling about himself and his concerns, in his easy light-hearted way. To him, it seemed that everybody must be as much interested in old books as he was. Suddenly, while he was in the middle of one of his little narratives, a change came over his face, and with a low moan he sank back in his chair. I loosened his cravat, and with Elspeth's help, carried him to the sofa. There was some-

thing in his face that alarmed me from the first, and I at once sent the woman off for the only doctor in the village. Dr Bond was not long in arriving. "A bad case—a very bad case," he muttered, after making a brief examination of the unconscious man. Then turning to my wife, he said: "Your husband, ma'am, I presume?"

"Yes, my husband, Captain Desmond," she answered, to my utter astonishment. "This gentleman," she added next moment, turning to me, "is one of his oldest friends, Mr Freshfield."

"I was too stupefied to say a word."

"I am sorry to have to tell you, ma'am, that you must be prepared for the worst," added Dr Bond. My wife pressed her handkerchief to her eyes and turned away.

"I need not relate to you in detail all that followed. My poor friend died in the course of the night, without having recovered consciousness for a moment. Next day, Dr Bond gave the necessary certificate, made out in the name of Marmaduke Desmond; and my wife ordered her widow's weeds. We were the only people in the secret except Elspeth Durham, and she was a woman from whom my wife professed to have no secrets. The funeral took place in due course, as you know, and to me the cruellest part of the affair was the necessity that existed for deceiving you; but it was a necessity. As I have already said, I was stupefied by my wife's assertion to Dr Bond that Freshfield was her husband, and that I was Freshfield; and no sooner were we alone, than I demanded to know her reasons for so strange a proceeding."

"The reasons are not far to seek," she said. "You are ruined, and nothing but beggary stares us in the face. That is an existence which will suit neither you nor me. Something desperate must be done to retrieve our fortunes. That something is here ready to our hands. This friend of yours—this Mr Freshfield—will die before many hours are over. He is a bachelor, living a lonely life in chambers; you met together by accident, and no one has any knowledge that he is here. Dr Bond knows neither him nor you. Why not pass you off as your friend, and your friend as you? No one need be in the secret but Elspeth Durham, and her I can trust implicitly. You must go into hiding for a while; and the insurance money will in due course be paid to me as the widow. With a nice little fortune like that, we can make a fresh start in life where we are not known. The risk we run will be infinitesimal; while to us the difference will be between starvation and ten thousand pounds."

"That I yielded to the force of her arguments, you know already; therefore, nothing more need be said on that point. I remained in hiding for a little while in some of the upper rooms of the house. You may remember waking up one night and seeing me by your bedside. I am afraid I startled you; but I could not resist coming to look at you."

"Well, everything happened as my wife had prophesied. After due inquiries, the insurance money was paid; and my wife came to live here for a time, where I have continued to pass as her brother. What we should have done ultimately, I hardly know; probably have made our way to some part of the New World; but that is a point on which it is no use speculating. We had not been here long, before an internal disorder, from

which I have suffered more or less for years, began to develop more serious symptoms. Those symptoms have gone on increasing, till they have made me the hopeless wreck you see before you. And now she has gone, fled from me, leaving me to die here among strangers. What a heart of stone that woman has! But let her go. I have some one here now whom I would not exchange for a thousand such as she."

Twilight had crept on apace while the sick man struggled slowly and painfully through his narrative, till by the time he had ended it was nearly dark. Wicked and base as she knew he had been, he was still her father; and by the time he had finished his narrative, Margaret had crept to his side and was kneeling by him. His hand was wet with her tears. "I will never leave you again, papa, as long as I live," she said.

"No, never again, Margery," he replied as he stroked her hair fondly. "Only, it will be a very brief time, as far as I am concerned," he murmured wearily under his breath.

Margaret did not hear. She arose and closed the window; and presently Jeanne appeared with the lighted lamp.

Captain Desmond rallied for a day or two after his daughter's arrival at Dieppe; but before long, a change for the worse set in, and at the end of a fortnight he breathed his last. His last hours were soothed by Margaret's sweet ministrations. During this time, nothing was heard of Miss Desmond, nor, in fact, did any authentic tidings of her ever afterwards come to hand.

When all was over, Margaret went back to London. Not knowing how long she might have to remain with her father, she had written to Lady Thorndale from Dieppe, resigning her situation as governess. She also wrote to Mr Ivory, although the confession she had to make to him was a painful one. For the time being, she contented herself with informing him that it was in truth his uncle who had died at Marlon on the fourth of April, leaving all further revelations for some future time.

A few days after her return to London, Margaret received a note from Lady Thorndale, asking her to call at Kensington Palace Gardens. Margaret went, and was received very graciously. It appeared that the governess who had succeeded Miss Desmond had failed to give satisfaction, and was already under notice to quit. If Miss Desmond would resume the duties which she had been compelled to give up, her Ladyship would be highly gratified to take her back.

The offer was too good a one for Margaret to decline. She was fond of children, and it would almost seem like going back home to find herself again at Lady Thorndale's.

"But perhaps," said Sir Theophilus in discussing the matter with his wife, "when Miss Desmond learns what a capitalist she is, she may not care to play the humble rôle of governess any longer."

"Miss Desmond a capitalist, Theo! What can you possibly mean?" asked her Ladyship.

"At the present moment, Miss Desmond is worth exactly fifteen hundred pounds; to that extent has the little nest-egg she was good enough to intrust into my hands multiplied itself. It may now perhaps be as well to withdraw the amount from the unstable waters of

speculation, and find some sound investment for it where it will bring in a reasonable rate of interest. But that is a point which Miss Desmond herself must decide.

When Miss Desmond had expressed her pleasure at the news imparted to her by Sir Theophilus, she determined to abide by her decision to return to Kensington Gardens, at least for some time to come. She had no other home, and a life without some definite aim or purpose would hardly have seemed to her worth living. So Margaret went back to her old duties; and after a week or two, it almost seemed to her as if the events of the last six months had been nothing more than a dream.

Margaret had a tender conscience, and she could not forget that the different insurance offices which had paid the policy on Captain Desmond's life had to a certain extent been the victims of a fraud. It was a subject on which she could not open her lips to any one; and after much painful cogitation as to what her duty really was in the matter, she decided upon remitting anonymously to the several offices, and as a sort of conscience-money, the thousand pounds which she had received after Captain Desmond's supposed death.

The events recorded above happened some time ago, and Lady Thorndale is again in want of a governess for her children. A few months ago there was a quiet wedding, at which both her Ladyship and Sir Theophilus were present, when Margaret Desmond changed her name to Margaret Ivory.

#### ELECTRIC LIGHT IN NEW YORK.

THE battle between Electricity and Gas has fairly begun. It is not hard to foresee to which victory will ultimately incline; but how long the contest will last, and whether electricity will owe its triumph to English, French, German, or American champions, are questions it must be left to Time to answer. There is, however, no denying that the signal for the fray was sounded on the other side of the Atlantic. How is the fight going there? A late issue of the *New York Sun* enlightens us on that point in a long article on Lighting by Electricity, from which we may gather sufficient to give our readers some idea of what has been accomplished in that way, more especially in New York, where the Brush Electric Illuminating Company has started work at five stations, and will shortly do so at a sixth. At these stations, seven engines, with an aggregate of five hundred horse-power, are now in operation, actually supplying three hundred lights of two thousand candle-power each. By twenty-three of these, part of Broadway is illuminated; the rest being let out to hotels, stores, theatres, and public gardens at the rate of a dollar a night per lamp. The Company has also engaged to supply seventeen lights for the Fifth Avenue, and undertaken the lighting of Madison and Union Squares by means, in each case, of six great lights of six thousand candle-power at the top of a mast a hundred and sixty feet high—expected to throw their rays a distance of a mile and a quarter in every direction. In the area of the city so lighted, it is calculated that five hundred and fifty gas jets will be displaced, and an enormous saving effected financially. Before long, the Company promises

to double the power at the generating stations, and by a newly invented method of storing electricity, hopes to reduce its operating expenses at least fifty per cent., and be enabled to let its lights by the hour, instead of by the night.

The United States Electric Lighting Company, employing two hundred hands, is daily turning out three dynamo-machines, fifty arc-lights, and five hundred incandescent lamps. Its offshoot, the United States Electric Illuminating Company, has four stations for supplying light, and is doing a tolerably good business in arc and incandescent lights among banks, public Companies, and the larger commercial firms. Its incandescent light is of thirty candle-power; and the Company claims to be able to light up any given area more cheaply than any gas Company.

The Edison Electric Light Illuminating Company, from which great things are expected, has not yet shown the New Yorkers what it can do, although busily canvassing the whole city previous to laying down its plant. It has, however, made arrangements for lighting up two districts, obtained the permit for laying down the street mains, and contracted for the execution of the necessary excavations. The iron pipes to be used for conveying the electric wires are two inches in diameter, containing two copper conductors, an inch in breadth by one quarter of an inch in greatest thickness, separated from each other and from the inside of the pipe by an insulating substance. In one district alone, the Edison Company has secured eleven hundred customers, for whose needs it will have to supply nine thousand sixteen-candle, and four thousand eight-candle lights. It has already, while we write, wired nine hundred and eighty houses for the introduction of the electric light, including one printing-office wired for five hundred and fifty, and another for over six hundred lights. This Company intends charging its customers according to the amount of electricity consumed as registered by electric meters; supplying them gratis with lamps, supposed to be capable of doing duty for eight months.

The Edison Company hopes to pay a good dividend out of the profit derived from the sale of motive-power alone. In its second district, there are two hundred and fourteen pumps for raising water to upper stories, two thousand three hundred and nine sewing-machines, and hoists and elevators employing an aggregate of one thousand four hundred and thirty-three horse-power; and the Company, we are told, 'is making contracts to supply electric motors for running all these.' Then it has a special department for marine business, which has already fitted up several coast steamships with the Edison Light apparatus, and holds a patent for an electrical railway. 'As soon as the first station in New York is lighted up, a section of the elevated railway is to be operated by electricity under arrangements already made, in order to test the working results of the invention.'

So many machine-shops in different parts of the States have taken to manufacturing machines for supplying light by electricity, that six of the leading Electric Lighting Companies have paid ten thousand dollars each into a common fund for the prosecution of infringers of their rights; claiming that no improved light can possibly be produced without infringing one or other of their patents. This promises well for the lawyers.

And this still better: 'Notwithstanding the league among the Companies, there is every prospect of a great war between them. The Fuller Company claims that its Gramme patent underlies the methods of all the Companies. The United States Company claims priority of invention for Farmer and Maxim, whose patents it holds, over Edison. The Brush Company claims that the other arc-light Companies are infringing its patents. Cross-actions are now pending between the Brush and Weston Companies, and the United States has suits pending against the Brush Company. When the Edison Company actually begins to sell light, there will be a legal fight between it and the United States Company. Eminent patent lawyers have been engaged, and a costly and prolonged struggle is expected.'

This is unwelcome news. Litigation means enhanced rates to the public, and a longer reign for gas, which as yet has been able to hold its ground. 'Notwithstanding that so many electric lights have been introduced in New York, the gas Companies report an increased consumption. The reason given for this is, that the electric light has created a demand for brilliancy of illumination, that increases the use of gas.'

#### 'SHANGHAIED.'

THE word which puzzles you in the title of this paper will not be found in Johnson, Webster, or other like literature. It is of such modern origin, that the time-honoured, old, Anglo-Saxon parts of speech contained in their folios would repudiate its society. But it has such a definite meaning for that part of the English-speaking family who are of the seafaring persuasion, that I am convinced it will not easily die out of the language. Its natal place is California, that great factory of words and phrases more remarkable for novelty and energy than for elegance; and it came into existence about forty years ago.

Many people still living shared in the first great Sacramento gold-rush, and can remember the numbers of vessels of all sizes, from the great Indianman to the tiny schooner, that were left forsaken in the harbour of San Francisco—captains, mates, seamen, and cabin-boys, throwing all scruples to the winds, having 'made tracks for the diggin's,' to share in the golden harvest. Some commanders and officers, however, to their honour be it told, resisted the 'fever,' remained staunch to their ships, and made every effort to obtain men to replace their faithless crews. They offered fabulous wages—twenty times the usual amount. They were willing to put into any port the crew might name, so it was some place where there was a reasonable chance of obtaining other men. But it was all of no use; they could not induce sufficient hands to join to make up the limited ship's company they were prepared to put to sea with. It was after they had exhausted every means of persuasion, that recourse was had to that most objectionable process, known as *Shanghaiing*.

*Shanghaiing* simply means drugging seamen, and conveying them on board a ship which puts

to sea before they recover, and was at the time above mentioned, and is still to a greater or less extent, practised in every foreign port where men have been scarce; and the rate of wages high enough to make it worth the while of boarding-house masters and runners to take the risk. Sailors usually get a month's pay in advance before sailing; and in the event of a man's being *Shanghaied*, those who bring him on board get paid that amount. So poor Jack has to pay his own kidnappers, who seldom get punished; for he rarely returns to the same port; and if he did, would usually be more intent on having a spree, than in putting the law in force against his betrayers. Moreover, it would be very hard for him to prove anything against them; for it is not such an unusual thing for a sailor to ship on board a vessel while he is intoxicated, as they would assert he was; and he would not be able to produce witnesses to gainsay them.

How *Shanghaiing* got its name, I do not know. Perhaps from some ingenious native of the Flowery Land to whom Shanghai had given birth, and who was one of the first to discover that keeping a grog-shop and supplying crews to deserted merchantmen, was just as lucrative and a more reliable speculation than gold-grubbing in the diggings; besides being an easy, gentleman-like business, requiring only genius, not muscle.

In the year 1870, I was second-mate of the barque *Kinajisha* of Liverpool. We were lying off Callao, having discharged our cargo, waiting for a charter. At that time, there was a great demand for guano, and we were expecting to sail in a day or two for the Chincha Islands, to load with that fragrant commodity. But the skipper knew that ships were scarce, and he stood out for a higher freight than the merchants were willing to give.

It was Saturday afternoon, and eight bells (four o'clock) had just struck. We had finished washing down and putting things snug for Sunday, when the captain—'old man,' we called him—came on deck.

'That rascal Achoy hasn't brought our clean clothes off yet, has he?' asked the captain.

'No, sir,' I replied; 'I've seen nothing of him.'

'Well, just take one of the boats, the gig, and give him a hint from me, that suppose I "no cathee clothes to-night he no cathee dollar;" and at the same time leave this letter at the agent's.'

'Ay, ay, sir,' I replied; and was diving below to put on a jacket, when he stopped me, saying: 'Hold on a bit. You had better take a couple of the apprentices to pull you ashore; for I don't want any of the men to leave the ship. Wages are high here, and there have been a good many desertions from the craft lying closer in.'

'Very good, sir.' And in a few minutes the two boys and myself were on our way ashore. We passed close to a large full-rigged ship called the *John E. Cherr*, flying the stars and stripes. She had come up laden from the Chincha Islands more than a week before, and I was surprised to find she had not sailed yet; for, making every allowance for the dilatoriness of the Peruvian dons, she had had ample time to get her papers and clear the custom-house. I remarked as much to the lad pulling the stroke-oar.

'Old Pietro the bumboat-man told me,' said he, 'that she is shorthanded; some of her crew having skedaddled for the Manito diggin's. Pietro says they are paying five dollars a day down there to strong hands.'

'Pietro,' I replied, 'had better keep his chattering tongue from spreading idle yarns aboard the *Kingfisher*, or his visits will be pretty soon put a stop to.—In bow; stand by to fend her off;' and we drew up to the landing-place.

At the same time the gig of the *John E. Chew*, which I had seen putting off from her as we passed, brought up alongside of us. The man in her sternsheets, whom I supposed to be the captain, was as tall, wiry, lean, and crafty-looking as a specimen of muscular humanity as ever hailed from Boston. The men who pulled did not look like foremast hands, and I took them to be petty officers, who could be trusted not to take French-leave. The Yankee skipper and I landed together; and I noticed, as I hurried off on my errand, that he took a good look at me.

The agent lived some distance off; and I suppose it was about half-past five o'clock when I turned into the street in which our Chinese washerman was domiciled. It was as disreputable-looking a thoroughfare as could well be imagined. The houses were shabby, one-storied wooden shanties, inhabited by seamen's boarding-house keepers, Chinese stevedores, and 'waterside characters' of all sorts; and every second house was a grog-shop. I was very thirsty, and was regretting that these latter had such a mean, uninviting appearance, when a placard with a bright red triangle, and the words 'Bass's India Pale Ale' conspicuously displayed on it, caught my eye. It was hung on the open door of one of the drinking dens; and glancing in, I caught a glimpse of the sinister features of the captain of the *John E. Chew*. I stopped. The temptation was great. It was months since I had tasted a drop of good English beer. 'Well,' said I to myself, 'what is good enough for the skipper of a big ship like that, ought to be good enough for the second-mate of a bit barquey; so here goes.' I marched in.

The place was very dark; but I saw the outline of a man behind the counter, though I could not distinctly see his face. He was leaning over, talking in low tones to the American captain. They both looked up as I came in; and in reply to my request for a bottle of Bass, the bar-keeper said, 'All right. Step inside, and I'll bring it to you.'

I had no wish to disturb their conversation, so I complied. I fancied afterwards, that as I passed into the room behind the shop, I observed a sharp glance to pass between the two whisperers, who were the only occupants of the place. The room I entered was a vile den, smelling most horribly of bad spirits and stale tobacco. As my eyes got used to the darkness, I saw it contained a rough table, all notched and stained, and a few battered chairs, on one of which I sat down. My beer was a long time in being brought in; and I shouted and hammered on the table several times before the bar-keeper appeared, with the bottle in one hand, and a large tall glass in the other. He said something in gruff tones about 'having had to go to the cellar for it;' and proceeded to draw the cork. As far as I could see, the glass was quite empty, and the capsule on the bottle undisturbed;

but as I had no suspicion of any foul-play being intended, of course I did not examine them particularly. As I said before, I was very thirsty; and I took a good long pull before setting the glass down. I then poured the rest of the beer into it, and was thinking of finishing it off and departing, when I felt a numb sort of sleepiness come over me. I knew at once I had been drugged, and made a rush for the door; but before I reached it, I staggered, and fell full length on the floor, where, after one or two ineffectual attempts to cry for aid, I became insensible.

I was awakened to consciousness by being roughly bundled into the sternsheets of a boat.

'Steady, Jack,' I heard some one say, 'or you'll be rousing him up.'

'No fear,' replied a gruff voice I recognised as the bar-keeper's; 'I gave him too good a dose for that. I guess he won't stir this side of sunrise.'

I knew by the sound of the oars that the boat had put off from shore; and knowing now that I was being Shanghai'd, I tried to call out for assistance. But my throat and mouth were wrapped round with many folds of a worsted comforter, which, while leaving my nostrils free, allowed only a muffled sound to escape. I tried to put up my hands to remove it, but could not stir them. A long monkey-jacket had been buttoned tightly round me, with my arms inside instead of in the sleeves, forming a veritable strait-jacket. My legs seemed to have some weight on them which prevented me moving them, and a slouch-hat had been placed on my head completely covering my eyes. I struggled, but it was no use. I was helpless as an infant.

'There! I told you so,' said the first voice; 'he's woke up.' And the oars stopped.

'Woke up! has he?' rejoined the bar-keeper. 'I'll soon give him some soothing' sirup, as'll put him to sleep agin. Just you ketch hold of his nose.'

I was lying on my back. Almost immediately, I felt a rough hand closing my nostrils. At the same time, some one pulled the comforter down from my mouth, and as I gasped for breath, forced the neck of a bottle between my teeth. I had no option but to swallow sputtering some of its contents. The bottle was then withdrawn, the comforter replaced, my nostrils released, and in a few minutes I relapsed into unconsciousness.

On again awakening, I found myself lying in the bunk of a small cabin. Tins of preserved meat, barrels of sugar and flour, and other stores of that sort, scattered around the place, showed me it was used as a steward's storeroom. The bunk had no mattress or bed-clothes in it. There was a port over it; and as the monkey-jacket and comforter had been taken off me, I raised myself and looked out. Callao was visible in the distance; but I could see, from the position of the shipping, that the vessel I was in was lying very far out. In fact, as I afterwards discovered, she had been moved to her present berth during the night. But the thing that interested me most was a British gunboat lying about the third of a mile off, and the nearest vessel in sight, her broad union-jack drooping over her stern. I guessed it to be about eight o'clock in the morning. I was about to try the door, when a key turned in it, and it opened for the entrance of no other than the captain of

the *John E. Chew*. I was not surprised, for I had already formed an opinion of where I was.

'Well, my lad, how do you feel now?' he said in a brusque manner.

'How do I feel?' I replied. 'Why, how should you expect a man to feel who has been nearly drugged to death?—as you very well know,' I added, looking straight at him.

'Ho, ho! that's how the land lies, is it?—Drugged, eh? I don't know anything about drugging; but I know you came on board last night in a state of beastly intoxication; so I put you in here, to take care of you, instead of letting you go to your proper place, the foc'sle.'

'My proper place! How is that?' I inquired.

'How's that?' he repeated. 'That's cool, that is. But I suppose the drink has knocked it all out of your head. Why, man, you've shipped before the mast with me, Captain Job Price, master of the United States' ship *John E. Chew*, port of New Haven, on a voyage from Callao to Trieste [Trieste]. Your wages is thirty dollars a month; and you've had a month's pay in advance, which I've got witnesses to prove.' He spoke this as if he were repeating a lesson which he wished to impress on my memory. But now, changing his tone to one of menace, which was emphasised by the display of a revolver which he drew from a pocket behind him, he continued: 'And look ye here, my lad; you'd better turn to and do your duty; for, if you try any of your shames on with me, you'll find you've got hold of the wrong boss! And now we understand each other, come on deck, and give a hand to get underweigh, for I'm going to make sail right away—I am.'

'I shall do nothing of the kind,' I said; 'and you had better put me off to my own ship, the *Kingfisher*'—

'Now, jest you shut up!' he interrupted. 'I want none of your lying yarns. I tell you plainly, that if you don't go to your duty at once, I'll put you in irons down in the lazarete until I get you in blue water; and then I'll string you up by the thumbs to the mizzen riggin', and lather you properly; and lead you a dog's life afterwards. Whereas, if you behave as a sensible man, I don't see why you shouldn't be as comfortable on board this craft as any other.' He spoke, and looked so determinedly, that I felt he would be as good as his word, and that my best chance would be to appear cowed and convinced; so, after a pause, I said: 'It's very hard that a man should be dragged off and shipped whether he will or no. But if it cannot be helped, I suppose I must make the best of it. Only, I warn you, Captain Price, that kidnapping a British subject is a very serious offence.'

'Oh, I guess I'll take my chance of that,' he replied; and stepping on deck, motioned me to follow him.

'Here, Mr Snell,' he called; 'this new hand has got sober at last, and wants something to do.'

'Ay, ay, sir,' replied the mate from the forepart of the ship, where he was superintending the men who manned the windlass. Then coming aft, he said: 'She's hove short, sir.'

'Very well. Loose and sheet home the topsails. We'll take a starboard cant with this breeze.—Here!—to me—let's see how smart you can be in loosing that mizzen topsail.—And mind you—

no tricks, or'—and he gave a significant look and a tap on his revolver pocket.

I would like to have strangled him; but I could only do as I was bid. As I went up the mizzen rigging, I gazed despairingly at the gunboat; but I could expect no help from her. She was too far off for a shout to be heard, even if I dared to raise one. And as to swimming, it would have been certain death, for the place swarmed with sharks. When I got on the yard, I saw a small shore skiff alongside amidships, which I had not observed before. Three men came on board from her, and my blood boiled as I recognised the villainous bar-keeper as one of them. 'Come on board to be paid for me,' I said to myself; 'and I've been sent up here to be out of the way.' I was confirmed in this belief by seeing them and the captain disappear down the companion-way, the latter making a warning gesture to me as he did so. He evidently thought I was completely tamed, and only wanted a reminder to keep me quiet. But at that very moment a ray of hope had flashed into my mind. All the ship's boats except the gig had been brought on board and secured. It was hooked on to the davit falls, but was still in the water. If I could but reach that boat, unhook the falls, and shove off, I could surely make such an outcry before I was captured as would attract the gunboat's attention. To cast loose and lower one of the other boats would take them at least five minutes, so I had only the skiff to take into account. The idea was no sooner conceived than acted on.

Grasping a back-stay, I slid rapidly down. Fortune favoured me. All the men who were not aloft were at the windlass. The fore and main topsails had been sheeted home, and as I reached the boat, the cry of 'All aweigh!' and the rapid clanking of the windlass palls, told me that the anchor had left the ground and the vessel was moving. A moment after, I was discovered, and I heard shouts and a hurried tramping along the deck. With nervous eagerness, I unhooked the falls; but my heart sank as I found the boat's painter was made fast on deck.

I felt in my pocket for my clasp-knife. By the greatest good luck, it had not been taken from me; an instant sufficed to open it, cut the painter, and give a vigorous shove against the ship's side. As I drifted under the stern, Captain Job Price's face appeared just above me. He had his revolver in his hand.

'Come back!' he cried with a horrible oath, 'or I'll drill a hole through you.'

My only reply was to throw myself down in the boat, and make as small a target of myself as possible; for I saw by the man's face he meant murder.

'I'll give you one more chance,' he yelled. But I lay close, for I knew the ship was gathering way every second, and his voice already sounded farther off than before. Another second or two passed, and then he fired. The ball struck a thwart above me, and glanced off. Again and again I heard the reports of the revolver, and each time the boat was hit; but I was not touched, the distance between us being now enough for the gunwale of the boat to be a protection to me.

When he had emptied all six chambers of his revolver, I stood up, and saw the *John E. Chew*

some fifty yards off, gradually stealing away before the wind; but I also saw another sight that was not by any means so pleasant. This was the skiff putting off from the ship in pursuit of me, with the bar-keeper and his two companions in it. I looked round the gig; there were no oars in it. I tried to drag out a thwart; but they all defied my efforts to move them. With the strength of desperation, I then tried the seats in the stern; and after repeated attempts, succeeded in loosening one of them. A final wrench, and it came away in my hands. It was about five feet long, nine inches in width, and an inch thick. I then commenced to paddle with it, first on one side, and then on the other, standing up and using all my strength, and shouting as loud as I could, to draw the gunboat's notice. But the boat was too heavy for this mode of propulsion to have much effect on her, and the skiff gained fast on me. The bar-keeper was standing in her bows, one man was rowing, and the other was seated in the stern. They said not a word as they came up. And when the bows of the skiff touched the stern of the gig, the bar-keeper made a spring. As he did so, I swung round my improvised paddle, and hit him with the edge of it fairly across the side of his head. He gave a howl, and fell over into the water, nearly swamping the skiff as he went down. In the confusion that ensued, the rower dropped one of his oars; and before they could recover it, pick up the half-drowned bar-keeper, and bale out the water they had shipped, I had, by vigorous paddling, put a good hundred yards between the two boats.

When the occupants of the skiff had recovered from their catastrophe, I was surprised to find that they showed no intention of following me. On the contrary, my friend the bar-keeper was huddled into the stern; and the other two taking an oar apiece, began to pull as hard as they could for the shore, at right angles to the course I was pursuing. I was greatly relieved; and on looking round, soon discovered the cause of this change of tactics—the steam-launch belonging to the gunboat was coming rapidly in my direction. As I afterwards found out, the reports of the revolver had been heard by those on board; and as the launch was just coming off from shore, she was ordered to proceed on, and see what was the matter. Captain Price had also observed that the British lion was on the alert; and the *John E. Chew's* main-topsail, which had been backed, was filled again; and she bore away under a press of canvas, leaving her boat with me as a trophy.

On the launch's arrival alongside of me, I told the middy in charge my story; and he, taking the gig in tow, took me on board the gunboat. I repeated my tale to the captain. He seemed rather incredulous; and sent an officer on board the *Kingfisher* to make inquiries, who brought my skipper back with him. However, as the 'old man' verified my yarn in some of its details, the naval captain began to take the thing up more warmly. But when it came to my producing legal proof of what had occurred, he seemed anything but satisfied.

'You see,' he said, 'you have not the ghost of a case against the master of the American ship. He, of course, would say that you came, or were brought on board, drunk, and that you agreed to sail with him. Nay, I have no doubt his officers

would swear to that or any other tale he might choose to invent. And if you were really one of his crew, he had a right to try to prevent you deserting. On the other hand, if he had wounded you, I should feel it my duty to give chase and bring him back; and as it is, I shall demand redress from the United States' consul.—With regard to this grog-drugging vagabond of a bar-keeper,' he continued, 'the case is different, and I think something might be done; so I shall take you on shore with me at once, to point out the house and get him arrested.'

Nothing was done, however; for on proceeding to the street in which I had been drugged, I found the houses so like each other, that I could not take it on my conscience to swear to any particular one as being the place; and as for the bar-keeper, he was not seen or heard of as long as the *Kingfisher* was in the neighbourhood. So I had, as our 'old man' said, 'to take the lesson for what it was worth.' And he added: 'Serve you right for going into such a den.'

I now command as fine a ship as the *John E. Chew*; and two years ago, I had the pleasure of meeting Captain Job Price—it was in Melbourne—and before we parted, he had received as good a 'lathering' as ever he promised me; and though I had made myself liable to a fine of five pounds, which I duly paid, I do not think I ever spent five pounds in my life with such a sweet consciousness of having got value for it.

## THE MONTH.

### SCIENCE AND ARTS.

AMONG the many interesting topics which lately came before the British Association at York, was the subject of Lightning-conductors, by Mr Vyle. This paper opened by alluding to the many accidents from lightning which are constantly recorded, and to the undoubted fact, that a conductor properly fixed and in good contact with the earth, is a sure protection from such calamities. The expense and difficulty of ascertaining whether a conductor already fixed is really in efficient order, may be estimated when it is stated that no tests can be made until a wire is connected between the very point of the apparatus and the earth. In the case of a high chimney-shaft, this expense would be almost prohibitive. Mr Vyle meets this difficulty by the invention of a new form of lightning-cable, which carries a core of insulated copper wire. This wire is in metallic contact with the point of the conductor, and emerges from the core a few feet above the ground, so that, by simple attachment of proper instruments, the efficacy of the conductor in case of thunderstorms can be periodically and easily tested. The necessity of some such arrangement as this was seen during the late examination of the wires which protect York Minster, when the earth connections were found to be faulty, although the conductors themselves were good. Under such circumstances, had lightning struck the building, the result might have been disastrous.

In the case of lightning, we are all anxious

enough to aid its escape to mother earth, where its power for harm is at an end. In the meantime, electricians are straining every nerve to procure in the easiest manner, and to store for future use, that electric energy which it is prophesied is to do so much of the work of mankind. Faure's improvements on the Secondary Battery of Planté have given a wonderful impetus to this particular branch of electric science; and although we have learned that the first accounts of his experiments were tinged with some perhaps natural exaggeration, there is no doubt that many things are now possible which were impossible before those experiments were made. We have now before us a drawing of the little balloon which, urged forward by an electric motor at a speed of two hundred feet per minute, forms a very attractive feature at the Paris Electrical Exhibition. This balloon, measuring about twelve feet long, is egg-shaped, but pointed at each end. It carries a Planté battery, which furnishes a current for nearly an hour to the motor, which drives a very light two-bladed fan. The balloon travels along a fixed wire between two galleries of the Exhibition building; and if it can be called nothing else but a toy, is at any rate a very interesting and suggestive one.

From the time when the Montgolfier brothers made their first experiments, now just one hundred years ago, the French have been eager supporters of everything in the shape of a balloon. But in our own country there are many earnest workers who are doing their best to give a practical value to that aerial traveller. Of these workers, Mr Coxwell is one of the most persevering, and from time to time he lets us know by letters to the papers that his ideas are not slumbering. The Crystal Palace, Sydenham, has lately been the scene of some experiments conducted by him, having for their object the perfecting of a system of signalling by means of small captive balloons. The fact that such balloons form conspicuous objects in the sky, easily seen from a great distance, coupled with the readiness with which they can be lowered or raised to form the combinations required by a pre-arranged code, will show that Mr Coxwell's ideas are not visionary. The system is meant to act as an adjunct to the heliograph, which of course cannot be worked unless the sun is actually shining.

The recent arrival in London of a consignment of fresh meat and game from Australia, transported from one side of the globe to the other in a frozen state, but which, in the opinion of competent judges, can, when thawed, be considered equal to home-fed stock, is an event of both scientific and domestic importance. It may also serve to remind us that beef and mutton from America have during the past five years been, by the same means, imported to this country in vast quantities; no less than one hundred and eight thousand tons of American meat having passed through the Metropolitan market alone; to say nothing of the

live-stock which has reached us through other channels. The question may naturally be asked, How much of this cheap foreign meat has been sold to the consumer for and at the price of British produce, and why? Alleged attempts to obstruct the sale of the Australian meat will form the subject of an inquiry by the Markets' Committee. The said Committee would gain the applause of the general public if they would at the same time take steps to explain why, with so much cheap food at hand, beef and mutton must still, by the masses, be looked upon as rare luxuries.

It is not meat alone that we may expect to receive from our Australian friends; for, according to a newspaper entitled the *Colonies and India*, the shipment of various fruits can be made remunerative. Apples, pears, oranges, walnuts, and grapes can be so packed as to arrive on our shores in marketable condition. The softer kinds of fruit can hardly be made to withstand the voyage; but there is every likelihood that those named will soon be competing with the produce of our gardens at home.

In no department of human industry is more ingenuity shown than in those wonderful modern implements of agriculture which have revolutionised the work of the farm; and perhaps the most interesting of these machines is the Reaper-and-Binder, which, as its name implies, not only cuts the corn, but binds it into sheaves. For a long time, these Reapers had one common fault. The binding medium was wire; and in spite of every care, particles of metal would find their way into thrashing-machines and into other situations where their presence was not desirable; so, tempting prizes were offered by different Agricultural Societies for a machine which would do equally efficient work, but which would bind the sheaves with harmless string. At a trial, lately, by the Long-Sutton Agricultural Society, Mr W. A. Wood's String Binding-machine cut six acres of wheat in less than five hours, tying each sheaf in two and a half seconds, the only interruption which occurred being when the ball of twine ran short. It is estimated that at least one hundred and fifty of these machines have been at work in the harvest-fields of Great Britain.

Those who are interested in farming pursuits will read with great interest a book written by Mr Douglass, on Ostrich-farming in South Africa. Employing a capital of about eight millions in Cape Colony alone, ostrich-farming may be now reckoned as one of the recognised industries of the country. Mr Douglass, who was one of the first to study this curious art as a profitable industry, has introduced with considerable success the system of artificial incubation. We learn from him, among other items, that the price of a pair of good birds for breeding purposes varies from one hundred to one hundred and thirty pounds; that each pair requires a run of about forty acres; and that they find their own food, except in severe drought; that the chicks will fetch six pounds each when only a day old; and that in process of time, each bird yields about twelve pounds annually in feathers. The greatest expense at starting an ostrich-farm is represented by the cost of fencing; but with good management, a net return of thirty per cent. can be reasonably looked for.

Miss Ormerod, of Dunster Lodge, near Isleworth,

who recently published *A Manual of Injurious Insects*, is still prosecuting her labour of love, which is likely to prove of great service to all interested in agricultural pursuits. She has been for some time collecting evidence, from all willing to help in the good work, bearing upon the injuries caused by insect pests to our food-crops, fruit and forest trees, the results of which up to the present time she publishes in the above work. She purposes continuing her researches and Reports, and with this view asks all who have the opportunity of doing so, to send her detailed accounts of the injuries which have come under their experience, and the remedies, whether effectual or not, which have been employed. In return for this information, which need only take the form of a few notes, with perhaps a specimen of the unwelcome insect, the writer will receive a copy of her printed yearly Report, telling him of the opinions and experiences of some hundreds under similar circumstances. Many of the pests which it is thus sought to eradicate, have had so much written about them, that there seems very little left to discover; but there are many others whose depredations go on year after year, simply because either no remedy has yet been found, or that remedy is only known to the few.

An instance of the obscurity which still hovers round many members of the insect world, is seen in the honey-ants. So little was known of the habits and nests of these intelligent insects, that in 1879 the Rev. Dr McCook undertook a journey to New Mexico, where they were said to be found, for the purpose of studying them. The results of his observations are recorded in the proceedings of the Academy of Natural Sciences of Philadelphia for January last. The nests of the honey-ants are generally found in high and dry situations, and have the appearance of mounds of gravel. A funnel-shaped opening leads to various galleries and honey-rooms. Observation would seem to suggest that the honey-ants are nocturnal insects, that the honey is secreted in the abdomen of the insect, which is distended into a bag the size of a small grape, and that it is procured from the sugary sap of oak-galls. It is rather acid, owing to the presence of formic acid; but the Mexicans and Indians eat it as a delicacy. A thousand ants will collect about one pound of honey.

The telegraph system in Japan can now boast of four thousand miles of line, comprising about ten thousand miles of wire. The first telegraph in Japan was constructed only ten years ago, so that the increase of mileage has been very rapid. A special adaptation of the Morse dot-and-dash system is used, because the Japanese language has no alphabet; but forty-seven signs are sufficient to meet all needs; and a school has been established for the education of Japanese youth into the mysteries of telegraphy and telephony. A curious difficulty is met with in the fact, that spiders have taken a fancy to weaving their webs between the telegraphic wires, with the result, that directly a shower of rain occurs, the webs become conductors of electricity, weaken the wire-currents, and thus play havoc with the messages. A staff of men with bamboo rods are constantly occupied in sweeping these tiresome cobwebs away.

In British Columbia, near Cape Commerell, large deposits of sand are found in which are

mixed tiny scales of gold. The gold is quite visible to the eye when the sand is penetrated a few inches from the surface; but its particles are so small, that no plan has hitherto been found of extracting it with profit. A San Francisco Company have, however, lately been treating this golden sand by means of a new machine invented for the purpose. It consists of a series of metal plates with holes through them, placed one above the other. These plates are covered with an amalgam for which gold has an affinity. The sand is, by means of water, washed through the pierced plates; and by the time that each charge of material reaches the bottom of the system, very few particles of gold have failed to attach themselves to the amalgam. The process is said to work well.

A natural product which has perhaps made as many fortunes in the New World as gold-mining, is petroleum. This industry was, for the best of reasons, considered to be an American monopoly; but, according to all reports, this monopoly can exist no longer. For a long time, rumours have been current of certain stores of petroleum which were believed to exist in North Germany. These reports were for a long time discredited; but there is no longer any doubt about the matter, for petroleum is now being pumped in large quantities near Peine, in Hanover. It is predicted that the new springs will be able to supply the whole of Europe with petroleum. This fact, coupled with the circumstance that Germany has hitherto been a large consumer of the American product, foreshadows changes of an extensive nature in a very important branch of commerce.

A recent discovery in Pennsylvania is considered by some to illustrate the formation of coal. At a place called Scranton, some excavations were being made for the foundations of a building. Cutting through a bed of peat, the workmen came to a stratum of what had the appearance of tough black jelly. When dried, this jelly becomes solidified into a brittle substance, hardly to be distinguished from anthracite coal, though upon analysis it was found to contain only twenty per cent. of carbon. It burned at a red-heat, and left an ash resembling that of ordinary coal.

Among the many plans which have been proposed for giving iron a coating which will protect it from rust, there are two which stand out prominently, by reason of their undoubted success; one is the process of Professor Barff, and the other that of Mr Bower. In both processes, the iron receives a coating of magnetic oxide; but the means by which this is brought about are different. Mr Bower has now purchased Professor Barff's patents, and a Company has been formed to work them, with the first-named gentleman as managing director, and with the latter as consulting chemist. When this Company is fully started, we may hope that non-corrosive iron will become a common, rather than an exceptional thing. We may mention that the colour of the coating varies from a gray to a deep black; and that to iron so treated, paint will adhere with great tenacity.

A great deal has been heard lately about koumiss, as useful in cases of consumption. The genuine article—which is in reality fermented mare's milk—is peculiar to one particular district, namely, the Steppes of Russia. Attempts to make it in Moscow and St Petersburg have failed, probably owing to

the want of that rich pasture which the Steppes afford. Russian physicians are now prescribing a visit to the Steppes for their consumptive patients, perhaps taking into account the fine dry atmosphere there met with, as well as the virtues of koumiss. This fermented milk has for years been the principal food of the Kirghizes, who are forbidden by their religion to indulge in stronger liquors; and it was the vast difference which appeared in the stamina of these men, according to the time when koumiss was seasonable or the reverse, which first attracted the attention of medical men to its regenerative properties. Dr Carrick, physician to the British Embassy at St Petersburg, is said to be contemplating the establishment of a retreat at Orenburg, where patients will be received during the summer. Here sufferers will have the benefit of a Madeira-like climate, coupled with the medicinal virtues of the new remedy. It may be added that the Aylesbury Dairy Company produce from cow's milk a species of koumiss which has been favourably spoken of.

The Glasgow Mechanics' Institute, established for nearly sixty years, has just taken a fresh lease of life under the new name of 'The Glasgow College of Science and Arts.' The whole nature of the Institution has been re-modelled, and its principal feature is now, by means of classes—to give young engineers, architects, builders, chemists, and technical workers generally, such a knowledge of their business that 'rule of thumb' shall give place to scientific accuracy. That the students profit by their instruction, may be gleaned from the results of the last Science and Art Examinations. In the drawing-classes—including geometrical and mechanical drawing and building construction—eighty-eight per cent. passed of those who presented themselves for examination, while forty-four per cent. took Queen's prizes. The other subjects brought forward as many, and in some cases more proficient. We wish the Institution every success under its new title.

According to a contemporary entitled *Iron*, there was lately to be seen in Queenstown harbour a novel fishing-vessel, which is perhaps destined to represent the type of fishing-smack of the future. It is described as a schooner-rigged steamer, capable of carrying one thousand tons dead-weight, including fuel. She had on board ninety tons of salmon and trout, which had been caught at Labrador and Sandwich Bay some ten days before her arrival at Queenstown. Her hold is occupied by refrigerating chambers, by which the fish can be kept in a frozen state for any required time. By the aid of such a vessel as this, fish need no longer be classed as perishable goods. The cargo could be disposed of by degrees, according to the state of the market; and more than this, the fish peculiar to one country could be easily transferred to another, where such had never before been seen in a fresh state.

In this connection, we may express a hope that the Committee lately appointed to inquire into the Metropolitan Fish Supply will be able to suggest some means whereby this wholesome and unlimited food can be brought nearer the mouths of the suffering poor. A gentleman lately wrote to the *Times* saying that at Great Yarmouth hundreds of tons of herrings are carted away for manure, merely because they are slightly broken.

The price which they fetch varies from twenty to twenty-five shillings per ton. It requires no great arithmetician to show that this waste fish could be sold in nearly any town in Great Britain at a handsome profit for one halfpenny per pound. In the *Gentleman's Magazine*, the following sensible remarks appear, from the pen of 'Sylvanus Urban': 'From the Billingsgate dealer down to the fisherman, all are in the conspiracy to keep up the price of what should be the cheapest form of food. This is a time of public Companies. In place of the schemes for working distant mines and placing British capital under foreign control, why do not some capitalists start a cheap fish-supply Association? This, while conferring a priceless boon upon the labouring poor, is bound, with judicious management, to prove one of the most remunerative of speculations. Everything, however, must be undertaken by the Company. It must have its own smacks at our principal fishing-ports, its own sailors, its own carriages for conveyance, its own markets. Fish could then be supplied at a fourth of the price now demanded. Some opposition from those interested in the preservation of existing monopolies is probable; a little firmness would, however, soon sweep this aside, and an investment likely to be little less profitable than the great water Companies and the like would be supplied.'

There is now being built at Geneva a model vessel, which if its constructors' anticipations prove to be correct, will cause quite a revolution in the art of ship-building. M. Raoul Pictet, to whose ingenuity this vessel is due, believes that he has discovered a new principle in ship-construction, by which the resistance offered by the water is very much diminished. By certain modifications in the shape of the hull and of the keel, the ship is caused to raise itself as it progresses, so as to assume a gliding motion over the water, instead of plunging through it. The particulars at hand are very meagre; and such being the case, it would perhaps be as well to withhold any opinion upon the merits of the discovery until the actual trial proves its value, or the reverse.

In many parts of Asia there is a plant known as the 'shoeblack,' which although it will not grow in our gardens, is not unknown in hot-houses. It possesses brilliant scarlet flowers, which yield a thick gummy juice, which gives a varnish-like polish to anything to which it may be applied; hence its use as a substitute for blacking on boots and shoes. The ladies of China are said to use the same plant for dyeing their hair and eyebrows.

The Agricultural Hall, Islington, one of the largest halls in London, is, despite its name, given up to Exhibitions of the most varied character. Only the other day, it was crowded with printing machinery; next came an Exhibition, the second of its kind, of everything pertaining to the leather trade. We are now promised in the same place a show of perhaps more general interest than either of those named. This is a Naval Engineering Exhibition, which, according to the anticipated programme, will embrace a very wide field indeed. It includes the exhibition of various systems of diving, in a tank specially constructed for the purpose; the delivery of lectures on naval architecture, mechanics, &c.; the exhibition of machinery and mechanical contrivances connected with the art of ship-building; and what is more

important still, a prize of one hundred guineas is to be offered for the best means of saving life in cases of shipwreck; a second-prize of fifty guineas being offered for the best invention of a humane character connected with seafaring matters. The Exhibition is being organised by Mr Samson Barnett, Junior, of 4 Westminster Chambers, London.

The United States Consul at Cartagena has issued a Report giving a very interesting account of the way in which india-rubber is gathered in Columbia. A hole is dug at the foot of the tree, about the roots of which a space has been previously cleared. The hunter then cuts in the bark a V-shaped incision as high from the ground as his arm will stretch. The milk then exudes from the cut, and runs into the hole below. When no more 'milk' can be persuaded to run by this process, the tree is cut down, gashed in every direction, whilst leaves are placed below to catch the milk that flows from the cuts. The rubber as it comes from the tree is as white as cream; but it speedily turns black on exposure to the air. It is coagulated in the holes where it has collected by means of hard soap, or the root of the mechvacan, when it is ready for market. This practice of cutting down the trees in order to obtain the rubber, is equivalent to killing the goose with the golden eggs; and there is no doubt that unless the government take stringent measures for their protection, the local trade in india-rubber will come to an end.

#### A RUNNING-MAN TARGET.

The mode of rifle-practice in use in the army and among our Volunteers has recently been the subject of much discussion in the newspaper press, and its efficiency has, among authorities qualified to judge, been gravely doubted. This has been especially so since the war in the Transvaal, when the very remarkable superiority of the Boers, compared with our English soldiers, as shots, was unquestionably determined. Our marksmen had hitherto practised at fixed and conspicuous objects, at regularly measured distances, and with all the leisure and opportunity that was requisite to raise shooting into something like a fine art. And, practised within these lines, the pursuit *did* in many instances assume the precision and elegance of a fine art, and the ability to strike a fixed object at a given distance, had, in the case of many individuals, arrived as nearly as possible at perfection. But shooting on a practice-ground, and shooting in the excitement and hurry and confusion of a battle-field, are two quite different things. To hit a moving object at three hundred yards, when that moving object has also a rifle, and can return our shot, is not quite the same thing as striving to make bull's-eyes on an iron target, with nothing to distract the mind or unsteady the nerves. Hence, our military authorities are beginning to acknowledge that, though they cannot introduce to the practice-ground the danger and smoke and commotion of an actual engagement, they can so far meet this deficiency by accustoming our soldiers and Volunteers to hit an object moving at lesser or greater distances, and at various rates of speed.

In view of this change in the training of marksmen, Mr W. B. Blaikie, of Edinburgh, has invented and patented what is called a 'Running-Man

Target,' which can be obtained at a price which places it within the reach of every Volunteer corps. The target is of stout millboard, cut to represent a man, life-size, and painted to the fancy of the shooter. It is suspended from a wire, along which it runs, and can be worked by one man, who, while operating, is protected in the ordinary marking-butt or manilett, and who does not require to leave the butt, but can signal the hits without leaving cover. It can be erected on any ground—rough, smooth, or sloping; and one or more targets can be run at the same time, and at any pace up to twenty miles an hour. On rifle-ranges, by an ingenious combination of two or more machines, the moving target can be made to appear at unknown distances each time, giving the riflemen the opportunity of practising snap-shooting. The targets, besides being light and cheap, can be patched on being struck, and are said to stand a good deal of hitting. Several military authorities, and among them Major-General Sir Frederick Roberts, have seen the target in operation, and are of opinion that it is likely to prove a success. The full measure of its success is, of course, a thing of the future; but that there can be no doubt as to the necessity for some such moving apparatus on the practice-ground, is forcibly shown by what happened in June last, at the annual meeting of the Edinburgh and Mid-Lothian Rifle Association, when the above running-man target was tried, and out of two hundred shots fired at it individually and in volleys, the 'man' was only struck *thrice*!

We may add that Mr Blaikie's apparatus is made by Messrs Wm. Bain & Co., Lochrin Iron-works, Lower Gilmore Place, Edinburgh.

#### A MEMORY.

A LITTLE village far away;  
A cottage near a hill;  
A verdant dene through which there flows  
An ever-murmuring rill.

A gentle maiden by my side,  
Reflected in the stream,  
Made lovely by her loveliness—  
'A dream within a dream.'

A little church behind the trees;  
A grave beside the wall;  
A stone; a few forget-me-nots:  
I loved her—that is all.

J. P. HUTCHINSON.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. To insure return in case of ineligibility, postage-stamps should accompany every manuscript.

3d. MANUSCRIPTS should bear the author's full Christian name, surname, and address, legibly written; and should be written on white (not blue) paper, and on one side of the leaf only.

4th. Poetical offerings should invariably be accompanied by a stamp and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

## A SELF-HELP SOCIETY.

'ANNUAL income twenty pounds,' was Micawber's advice from the King's Bench Prison, 'annual expenditure nineteen nineteen six—result happiness. Annual income twenty pounds, annual expenditure twenty pounds ought and six—result misery; the blossom is blighted, the leaf is withered, the god of day goes down upon the dreary scene, and—and in short you are for ever floored!' Now, in most cases, the sixpence cannot be kept upon the right side of the account, and there is risk, if not of being 'floored,' at least of falling very low in anxiety and discomfort, if there be not Thrift in the management of the annual—figurative—twenty pounds; and thrift is not among the good qualities of the English people. In the highest classes there is extravagance, which however unwise, can in their case be afforded; in the middle classes, the craze of keeping up appearances, and living up to or beyond the income; in the lower classes, bad management in buying and living, and lack of the power of saving a provision for times of scarcity and for old age.

It is among the middle classes and the less educated, that thrift is not only a virtue but a necessity; and a Society was founded not long ago, with the aim of furthering the welfare of all the bread-winning classes by teaching them to make the most of their winnings. Situated in Finsbury Circus, London, E.C., this excellent institution goes by the name of the National Thrift Society. Its object is none other than to make thrift a national habit, as it is already in France, Belgium, Germany, and Austria; and as the Society is not a mere body for holding meetings and proclaiming theories, but a thoroughly practical body, only content when it is reducing its principles to action, it may be interesting to glance at the plans of such a Society, and the means it employs 'to make regular and systematic thrift a national habit.'

The Thrift Society starts from the principles, that the best possible assistance is helping people to help themselves; that a habit of economy is

most easily acquired in early life, and therefore thrift-teaching, theoretical and practical, should be part of the instruction given in schools; and that by preaching Thrift they mean, 'not that shabby savings should accumulate into sums that would minister to selfish abundance, but that every one should endeavour to husband his resources, and at the same time use them to the best possible advantage not for himself alone, but for the good of his fellow-men.' The working classes, and especially the poorest of them, are those who fall most within reach of the efforts of thrift-promoters; and by benefiting first those easily reached classes, it is hoped that the movement will spread upwards through others where there is equal waste and where there might be easier saving.

The principal means adopted by the Society for doing its work, may be counted as seven—the establishment of Penny Banks, the drawing of popular attention to the Post Office and Trustee Savings-banks, the explanation and arrangement of Life Assurance and Annuities, the opening of Provident Dispensaries and Medical Clubs, the supervision of the system of Friendly Societies, the deliverance of popular Thrift Lectures, the holding of Conferences, and the broadcast free distribution of Thrift Literature in the form of 'Leaflets,' cards, and pamphlets.

To speak first of the Penny Banks. The Society will only be satisfied when there is one of them attached to every elementary school in the kingdom, and to all workmen's Clubs or Institutes, Factories, and Temperance Societies; and to make the opening of these Banks more easy, printed forms of application are issued, upon the receipt of which from any district, the requisite books, trustee forms, notices and rules are forwarded ready to set the business in order. Several Penny Banks have been established in London—quite distinct from the National Penny Bank, which is a commercial undertaking, while the Thrift Society's work is one of disinterested benevolence—and many others have been opened in provincial towns, and even in villages far and wide throughout the country, from Nether Comp-

ton in Dorsetshire or Hersham in Surrey, away north to Auchencraigs in Scotland. Several of these Banks have more than a thousand depositors. When those in poor districts of London were opened, the rush on the first night proved how desirous many working people are to save the 'littles' that make a 'mickle,' if they are but shown easy and safe means of laying them by. At one place the depositors numbered five hundred in the first two hours, and eight hundred names of men, women, and children were on the books before the end of the month; at another, there was among the crowd a mother who had come to make a deposit in her baby's name—an example of the depth of popular pleasure and interest in the movement. A similar good work is being done in their own provinces by Savings-bank Associations in Glasgow (by which Board School Banks were successfully opened in 1877), Liverpool, and Manchester. There are also, elsewhere, districts where the Penny Bank movement is already well established—for instance, there are fifty in one manufacturing district of Bedfordshire. But the National Thrift Society is too honest and earnest, to know anything of the too common blemish of jealousy among fellow-labourers. Its object is purely to help the working classes to make the best use of their earnings, and to save; to teach them to help themselves; and to set others helping them. If others are already helping, so far good—the object being to make the system universal.

To establish Penny Banks in elementary schools is the Society's foremost aim at present. The district Banks benefit many, but chiefly those who are desirous of receiving the benefit—those who are already inclined to save. The School Banks would do more: they would form practically, at the most plastic period of life, the inclination to save and the habit of saving. The head of the Education Department has recently given his approval to a plan of the Thrift Society for establishing a Penny Bank for the children of every Board School in the Metropolis, if the consent of the School Boards, who are already favourable to the scheme, could be formally obtained. Once London Board Schools had accepted the banking system, those of the provinces would follow. In many elementary schools the Society has already tried the plan, and the teachers everywhere give the same testimony—that it is beneficial to the children and to the school, and that it forms a new link of good-will between the school and the parents. The business is very simple; the money, chiefly in copper, is handed in, on Saturdays or Mondays, in the school-room; and when an account reaches a pound, it is transferred in the child's own name to a Post Office, or to a Trustee Savings-bank. Sometimes Bank Books with a small sum entered, by way of a nest-egg, are given to the children as prizes, and are greatly appreciated. This has been done largely in Belgium, where the system of School Savings-banks is an immense success.

Thrift makes a very practical part of education in those countries where the system has been introduced. In Belgium, legacies are sometimes left to be divided in the School Bank Books even during so long a period as twenty years, to reward the thriftiest scholars. Ghent stands foremost in the movement; five thousand pounds have been

laid by in one year, by ten thousand children out of the sixteen thousand that attend its schools. Belgium has also its Thrift Society, called 'The *Société Cullier* for the Moral Improvement of the Labouring Classes by Means of Saving,' its object being further explained as that of 'spreading amongst working people the spirit of order and economy, and thereby improving their condition both moral and material.' In France there is a similar Society, having for its object to encourage the already existing provident institutions, and to found others. In 1874 the School Bank movement began there, and now more than eight thousand Savings-banks are attached to French schools. It is worthy of note that the amount deposited in French Savings-banks, which had greatly diminished after the last war, rose again with a regular increase of no less than a hundred million francs a year, since 1874. This is attributed to the founding of the School Bank system, for it is well known that the savings of children are an incentive to their parents to begin saving too.

The French schools have before now proved in the most practical manner that Thrift does not mean selfishness. In 1876 the schools of Bordeaux had some of the most prosperous of the Banks established by the *Société des Institutions de Prévoyance*; and when the disastrous floods of that summer swept over the south of France, the children of Bordeaux came forward with four hundred pounds of their own money for the relief of the sufferers.

We have enumerated as the second means of thrift-teaching, the directing popular attention to the Post Office and Trustee Savings-banks. It is desired that investments in Government Funds should be reduced to five pounds or lower, as the present ten-pound limit fails to benefit the class for whom the last reduction was intended. But it is very difficult to get the uneducated to understand anything about government investments. As a fact, when Consols are suggested, it has been asked if Consols are a kind of coals, or 'something new in the way of eatables.' It is easier to make the simple Post Office system acceptable, and yet few understand how valuable is the whole system of saving. It would be news to most working-men to hear—as the Thrift Society tells us—that the sixpence a day, which many a well-paid artisan spends upon glasses of beer, if saved and put by at compound interest from his twentieth year, would face him in his seventieth year as the goodly sum of one thousand pounds.

As a third means of working, the Thrift Society advocates Life Assurance and the obtaining of Annuities. Through their efforts, arrangements have been made by which insurers can obtain policies in certain Life Assurance Offices at a reduction of premiums, and can also purchase Annuities on easy terms. Great as the extravagance of the middle classes may be in living up to or beyond their income for appearance's sake, there is still a vast amount of providence in paying for Life Assurances; and this is a hopeful sign of the spread of thrift. Where such insurance is not made, there are frequently those cases of the death of the bread-winner, and the sudden destitution of the family, which are among the saddest fruits of the modern universal sacrifice to appearances.

A fourth method of promoting thrift, is the

establishment of Medical Clubs and Provident Dispensaries; and several of these have been already opened. Though staunchly advocating the grand virtue of self-help in every condition of life, we should be far from desiring to lessen the tide of charity to those who really need it, or of lessening those medical charities which are the special outlet of human tenderness and the glory of the civilised world. There will be always the poor, the deserving poor, to whom all Charities, and especially the charities of healing and sheltering the sick, must open their resources wide and free, and still have scarcely resource enough to satisfy misery on the one hand or compassion on the other. But there are also large classes—as in former articles we have insisted—who could well afford with a little prudence to partly or even wholly defray the expense of their times of sickness. The Provident Dispensaries are a welcome boon to those who are honourably wishful at least to pay something for their medical attendance; and if the system could be extended, and families induced to make their trifling weekly or monthly payments, it would benefit the hospitals and free dispensaries by relieving them of a great strain on their funds, besides encouraging people to have recourse in good time to medical aid that they had already entitled themselves to receive. But, once again, the Provident Dispensaries are not intended to take the place of medical charities. There will always be thousands who must have free aid freely given; there will always be the neighbour found fallen by the wayside of life, with the necessity laid upon us not only of giving healing remedies for his ills, but of ourselves paying the provident fee that care may be taken of him when we are gone.

The supervision of the system of Friendly Societies is another, and a very necessary, work taken up by the National Thrift Society. Notoriously unthrifty as the English people are, their working-men's Associations are a proof that somewhere in the national character there is a strong bias of prudence; and therefore the forming of the nation to systematic habits of thrift, though a long labour, is no impossibility. The registered Friendly Societies of the kingdom are no less than twenty-five thousand in number; one of them has five hundred thousand members, and another nearly as many; the amount invested in them is close upon eleven millions sterling, and the money paid out by them annually is about two millions. These are large figures, and honourable statistics too, when we remember that these associations have been founded and carried on by the enterprise and good management of the working classes. Beside these, there are existing unregistered Societies; and whatever be their 'Club,' the majority of well-employed working-men will be found to have some 'Club' to call their own, or at some period of their life to have paid into one. The generality of these Societies are sound, and admirably managed; as an instance of good business management, we could name one of the largest, that, finding itself a few years ago with an enormous deficit, readjusted its rates by mutual agreement, surmounted the difficulty, and now boasts that instead of a deficit, it finds some trouble in dealing with the swelling amount of

its surplus. But there are other Societies that are helplessly unsound. They often exist in towns, but more commonly they are Clubs in country villages; and so badly are some of these managed, that a case has been known where a village Club kept its money in a box with three locks, not even putting it out to interest, but trusting in some vague way for its ultimate increase.

Without such special study of the subject as the National Thrift Society has made, no one can know the amount of misery that is wrought among the poor by these rotten Societies. In most of the workhouses a large percentage of the old and destitute have at some period of their lives subscribed to a Friendly Society; and statistics show that of this number, a third, after subscribing their hard earnings for years, have been left to the dreaded 'House' in old age, through the failure of the Society in which they trusted. In London workhouses, there are men who have thus saved and subscribed for as much as thirty-five years, and who in their hour of need, when they were past work, saw their savings gone and beggary before them, through the breaking of the Club. The sufferings of the poor in this respect have a heart-rending voice even through dry statistics; and herein is shown the beneficent character of the National Thrift Society, which, undismayed by the usual jealousy of interference shown by workmen's Associations, has fearlessly taken in hand the duty of watching over the savings of the poor. It desires that there be further legislation on the subject, to supplement the Act which was passed in 1875 after the long investigation by Royal Commission; and it is to be hoped that the Society will not rest until it is impossible for foulhardy speculators, whether themselves working-men or not, to stake, in a huge game of finance, the earnings saved by work-worn hands for times of sickness, sorrow, and old age.

The sixth method of work needs no explanation. The Thrift Lectures are entertaining as well as practical, and the Conferences are not dinner-eating celebrations, but practical meetings of those who are specially concerned with the ways and welfare of the labouring classes.

Of the Thrift Leaflets we have more to say. They are plain and friendly in language. Some are meant for the young, others for female servants, for cottagers, for workmen of various kinds, and for perusal in households. Their good advice and sensible reasoning teach housekeeping economy, saving little by little, and the much-neglected virtue of Temperance. They are issued by hundreds and thousands for gratuitous distribution; some zealous workers send them by post in coloured envelopes, and freighted with good wishes; they are given out at the Penny Banks at various meetings, and in such centres of work and poverty as the London knot of close poor streets known as the Seven Dials. Sometimes the quantity asked for is enormous; in answer to one request, ten thousand were sent to a district in the East End of London, for distribution on an Easter Monday and Bank-holiday.

Many voluntary subscriptions are of course necessary to carry on all this manifold work, and the Society has certainly to begin at home its lesson of Thrift while it is striving to gather funds for its fast multiplying labours. It has before it a noble work; for with Thrift come many blessings

and household virtues, foremost among them temperance, and the spirit of honest industry. The moral condition of the mass of the labouring population would improve, as their social condition became better, through self-help. They would live better, dress more suitably, enjoy homes of more real comfort. The Home of Taste, which Ebenezer Elliott dreamed of, would then be a possibility. The earnest-souled Poet of the Poor wrought commonest things into poetry when he told of Saturday's work done by loving hands for the sake of 'the proud mechanic—rich as a king, and less a slave—throned in his elbow-chair.' He sang of beaten carpets and white-scoured floors and polished grates, the weather-glass beside the cupboard door, the neatly mended sofa-arm, the warm house when Autumn winds were blowing, the snow-white curtain strung with pink tape, the musical glasses and songs, the table full of books, the fresh flowers in the vase. The Poet called it the Home of Taste; but still more was it the Home of Thrift.

### THE FORTUNES OF BERTRAM OAKLEY.

BY JOHN R. HAWWOOD.

#### CHAPTER LIII.—IN LOWER MINDEN STREET.

'HAVE you heard it, then?' said Bertram, with a start, as he entered the little triangular parlour of Louisa Denham's modest lodgings in Lower Minden Street, and saw, by the dull glow of the firelight and the pale gleam of the shaded lamp, that Miss Denham was in tears. 'But it is impossible!' he added; for it was the very evening of the trial which had had so tragic an ending, and Bertram had preferred to be the first to bear the news to his old benefactor's daughter, rather than leave her to learn it on the morrow, through the unsympathetic medium of a newspaper report.

'Of what did you speak?' asked Louisa timidly, when they were both seated.

Bertram fixed his eyes upon the fire. 'I have come straight from court—from the trial, I mean,' he said, with some embarrassment. 'It has terminated in a sad way—sadder, even, than we all expected from the first.'

'He is condemned, then?' inquired Louisa.

'The jury brought in a verdict of guilty; they could do no less,' said Bertram gravely.

'And his punishment—he is our uncle, after all—is it very heavy?' asked Louisa gently. She had been very angry with Walter Denham, the supplanter, the suborner, the robber of a trusting brother, whose nature had been so noble, tender, and good. But, like a true woman, she did not wish the chastisement to be heavy.

'Mr Walter Denham is beyond the reach of earthly justice, and that by his own act,' answered Bertram. 'He must have been prepared for suicide, should matters go hardly with him, since he had the poison, artfully concealed about his person, from the time of his arrest to that on which he swallowed it in open court, when once the verdict of the jury had been pronounced.'

Louisa bent down her honest, homely face upon her knees, and wept, sobbing—not for the hard, polished kinsman who had passed away, but for the ideal uncle, the imaginary Walter, whom their dear, dear father had loved so warmly. How often had the kind doctor dilated by the domestic hearth

on the merits of his bright, gay young brother, born, as it would seem, to take the sunny side in life, and be blithe and cheery! Dr Denham had really seemed to consider his younger brother as an exceptional person, exempt from responsibility, a mere lotus-eater, one whose privilege it was to soar above the cares and toils of other men. Uncle Walter in the flesh had been very vile. Coarser greed no buccaneer could have shown than had belonged to this accomplished, urbane gentleman, to whom so much had been forgiven by the brother he had wronged.

'It is a sad, miserable story,' said Louisa at last; 'and then my Rose, my poor darling, was tormented, too, by the addresses of a ruffian who knew the wicked secret, and—— But he is dead; and my blossom will be safe with you, Bertram, brother.'

'You call me brother,' said Bertram, 'and, dear sister, I am proud of the name. I am half-ashamed, remembering the poor, self-taught lad I was, when first your father took me by the hand, to think that darling Rose should be my betrothed bride; and your own kind, generous self a sister to me. Yet we live in a new and stirring age, when men, and women too, are shaken out of the old traditionary grooves, sadly rusted, of the past.—I have not told you, Louisa, how rich I am;' and Bertram smiled, half-diffidently.

'I have seen, by the newspapers, your great success—yours, and Mr Mervyn's—and that to your genius and perseverance the credit was due!' exclaimed Miss Denham, with a woman's instinct of hero-worship. 'And how proud, and how pleased, Rose and I have been, you will never know.'

'But I really am rich—and growing richer—week by week,' answered Bertram. 'What have we done, in the Firm, but divine, a little quicker than others, the drift which the world's sea-borne commerce ought to take; and lo! the world seems in a hurry to lay the first-fruits at our feet. It would weary you, if I were to enumerate the tempting offers which we daily receive from those who wish to buy up our contracts, to take our concessions off our hands, to reap the golden harvest that we have sown. My own share, I am told, is great, and likely to be greater, for the patents prosper; and I can no more help inventing, than an apple-tree can help putting forth fresh bloom when summer comes round.'

'Oh, how glad I am!' said Louisa, 'both for your own and Rose's sake.'

'I am sorry, however,' Bertram said, and he spoke low and feelingly, 'that you will not be much the richer by the discovery of your uncle's treacherous conduct towards your father. I learn from his agents that his affairs are very much complicated. He had been living a fast life, passing himself off at the same time as a connoisseur of art, and frequently losing large sums of money in speculations which any man of sense could have told him were worthless. The consequence of it all is, that the residue which may be saved from the wreck of his estate, which otherwise should have yielded four or five thousand a year, will now scarcely yield as many hundreds. Of course, you and Rose are his heirs, and are entitled to have the estate divided equally between you. But, dear sister—allow me to

call you by that name—Rose and I have had the matter talked over days ago. We had resolved, if the trial ended in the restitution of the estate to your father's representatives, that the result, whether much or little, should be entirely made over to you, Rose taking no share whatever.

'But,' said Louisa, blushing, while the tears sprang to her eyes, 'I cannot have this. Rose is entitled to her own, and'—

Bertram, by a kindly interruption, prevented her saying more. 'There's no help for it now,' he said. 'My agent has received instructions from Rose so to arrange matters, and it must be done. We do not require it, you know. My prospects are good; my income for some time has been very much larger than I could use, and the money is of no consequence to us. We are making no sacrifice, therefore, in giving up the whole to you; and I hope the estate may turn out better than is presently anticipated. The house at Kensington, with its pictures and curiosities, will of course be sold; and it is just possible that the present rage for bric-a-brac and the like may result in handing over to you a much more handsome sum than I first suggested.'

'Yet,' said Louisa, 'is it not sad to think the poor man should have sacrificed all that was good and honourable in him for the sake of paltry gain! He could not expect to prosper, and he did not prosper; and I do not know whether I shall ever have any pleasure in what comes to me through such a source.'

'Such considerations need have no weight with you, dear Louisa. The money that comes to you will be rightfully yours. It should have been your father's; but the successful plottings and rascalities of bad men deprived him and you of it for a time; and now that, in the mysterious ways of Providence, the estate, or what is left of it, has returned to you, it comes as free and untainted by any stain of crime or knavery as if it had never been out of your father's possession.—But, Louisa, when I entered, I thought I found you in tears. You have not had any bad news, have you?'

'I had just received a letter informing me that my kind old friend, Miss Elizabeth Midgham, of Blackston, she who first made it possible for me to earn daily bread as a governess in great stony-hearted London, was dead; and as I thought of her, dear gentle lady, and all her kindness to me, I felt as if another tie to life were wrenched away.'

'Yes,' said Bertram, 'she was a kind friend to you, and had she lived to see you in more improved circumstances, none would have rejoiced more heartily with you. But,' he added in a cheerier tone, and as if desirous to change the current of Louisa's thoughts, 'I hope that brighter days, dear friend, are in store for us all, and that we shall all be happy together. I daresay Rose has mentioned in her letters that Mr Arthur Lynn is very attentive to Mr Weston's niece, Miss Julia Carrington?'

'Yes; Rose has spoken of that.'

'I should not wonder, when summer comes round, if there were to be two weddings on the same day in old St Mary's Church, at Southampton,' said Bertram, as he rose to go.

#### CHAPTER LIV.—SUCCESS.

There is nothing—so the modern proverb affirms—that succeeds like success; just as the massive

fly-wheel of a steam-engine maintains strength and speed as its massive steel periphery spins round in endless revolutions. So it was with the sudden prosperity of a firm already prosperous, already wealthy, known, now, by the appellation of Mervyn, Lynn, and Oakley. It needed the cool, shrewd head of the veteran shipbuilder—it needed Bertram's eagle sight, and the keen common-sense which is not invariably found allied with genius, to enable the house to steer its way, now, among the many shoals and sunken rocks that beset commercial speculation on a great scale. On one hand, close-listed men of business, moved to unusual excitement by the near prospect of gain, were offering Messrs Mervyn large sums to dispose of their bargains; on the other, sanguine projectors were urging them to become the backbone of a huge Joint-Stock Company that should throw into the shade all rivals, and dwarf the puny efforts of individual capitalists in the same line of business. It required much tact and discretion to keep, under such circumstances, to the right path, to know what proposals to reject, and what to accept; and the difficulty was somewhat complicated by the preponderance of Bertram Oakley's undoubted merits.

'It is all your doing, boy—never a doubt of that,' said Mr Mervyn once, in his nephew's presence, to his young partner. 'But for you, and that fiery, busy brain of yours, Bertram, we should be going on here in the old jog-trot way, thriving, as I trust, but not coining money, as the City folks call it, as thanks to you, we are doing. Well, have you had enough of Tom Tiddler's Ground? Shall we close with Messrs Cleek and Gripper's offer—or that of Macnesh, Brothers, for the sale of our new home and foreign contracts—their magnificent offer—as the solicitor for the first-named gentlemen very excusably calls it? It is, no doubt, a great sum of money.'

'But, sir, it would be selling our birthright, like Esau, for a mess of pottage,' cried Bertram eagerly.

'So I think,' said the old man, with evident pleasure; 'but it is but fair, Bertram Oakley, to give you an early chance of profiting by your talents. If you choose, on the strength of the share that would justly be yours, you might settle down, on your marriage, in a life of leisure and comfort, such as many of us working-bees look forward to as the goal of a successful career, and—What say you?'

'I say, sir,' returned Bertram, smiling, 'that I aspire to nothing better than to keep my place among the working-bees, if they will have me, and should be stupid and miserable as a drone. No, no, dear Mr Mervyn; to you, and to Mr Arthur here, I leave it to decide where we shall sell, and where hold fast; but let no decision of yours be influenced by a good-natured wish to lay Bertram Oakley on the shelf, while he can be of use to others or himself. It was yourself who taught me, sir, the true use of wealth, and what, in worthy hands, it can effect. Your pupil, Mr Mervyn, will try to profit by the lessons of his master.'

'Well, then,' rejoined the head of the firm, as if a load were lifted from his mind, 'we shall make short work, civilly, of Cleek and Gripper, and of the Belfast people too. Some of the other applications are of a less sweeping character.'

The business of the firm still grew. Fresh works, extended premises, new docks, new smithies, sawmills, foundries, sprang into being at the magic touch of intelligence backed by means. The names of Mervyn, Lynn, and Oakley were on all men's lips; rumour exaggerated their considerable and growing gains, and brought, as happens in such cases, grist to the mill in which the grain is of gold, not wheat. Had Long Tom and his fellow-wrights had as many arms as Briareus—had every square foot of the Yards been multiplied tenfold, Bertram and his partners could not have built, or 'converted' one half of the ships for which mercantile companies, private owners, and Ministers of Marine sent orders. It was necessary to have wheel within wheel, contract within contract, to make use of other ship-yards to supplement the lack of hands and space; and this necessitated incessant labour, much oversight, tact, clear judgment, and steadiness of purpose.

'It ought to be Oakley and Lynn; not Lynn and Oakley, I know that—and I told him so, a week ago,' said Arthur, almost penitently, to Mr Mervyn, 'one day, as he was descanting on the swift and smooth progress which from day to day went on. 'I do n't best; but with Bertram it is like witchcraft, for he never seems, when he has got through a mountain of work, in that quiet way of his, to realise that he has done anything astonishing after all.'

'We will all do our best,' answered the principal cheerfully; 'and no man, I fancy, can do more. But Bertram is one in a thousand, and riches will no more spoil him than success has made him vain, or warped the gentle manliness of his honest nature. He is the same to-day as when he stood here, a poor messenger lad, gazing at my models in their glass case.'

#### CURIOSITIES OF OLD PARLIAMENTARY ELECTIONS.

UNTIL about the close of the seventeenth century, very little appears to be known concerning parliamentary electioneering, as it was not till this time that it was much or notoriously practised. At that period, however, and up to the passing of the Reform Bill, the system of parliamentary representation was exceedingly defective. According to a statement by the Duke of Richmond in 1780, a majority of the House of Commons was returned by not more than six thousand men; and in the petition of the Society of the Friends of the People in 1793, it was mentioned that eighty-four persons absolutely returned one hundred and fifty-seven members to parliament; and that seventy influential individuals secured the return of one hundred and fifty members; so that in this way three hundred and seven members—which, before the Union with Ireland, constituted the majority of the Lower House—were returned thereto by one hundred and fifty-four patrons, of whom forty were peers. Indeed, in 1821, Mr Lambton stated that he could prove at the bar of the House of Commons that one hundred and eighty persons returned three hundred and fifty members, by nomination or otherwise.

No abuse appeared to be more grievous than the great control which the members of the House of Lords had over the second branch of the legisla-

ture. In the latter, the Duke of Norfolk was represented by eleven members; Lord Lonsdale, by nine; Lord Darlington, by seven; and the Duke of Rutland, the Marquis of Buckingham, and Lord Carrington, each by six. Again, it appears that by the nomination or influence of eighty-seven peers, no less than two hundred and eighteen members were returned for counties and boroughs in England and Wales; one hundred and thirty-seven were sent to the House of Commons by ninety commoners, and sixteen by the government—making a total number of three hundred and seventy-one nominee members. Thirty-one of the forty-five members for Scotland were returned by twenty-one peers, and the remainder by fourteen commoners. While of the hundred representatives for Ireland, fifty-one were returned by thirty-six peers, and twenty by nineteen commoners. The result, therefore, was, that of the six hundred and fifty-eight members of the House, four hundred and eighty-seven were elected by nomination, and only one hundred and seventy-one by independent constituencies.

We are told that neither of the 'rotten boroughs' of Midhurst and Old Sarum had a house remaining in it. According to some returns submitted to parliament in 1831, it appears that the boroughs of Beeralston, Bossiney, and St Maw's each contained only one ten-pound householder; Dunwich, Belwin, and Castle Rising, two; Ludgershall, four; Bletchingly, five; West Looe and St Michael's, eight. Further papers showed very marked contrasts between the revenues obtained from the disfranchised and the enfranchised boroughs by the Reform Bill. For example, while Beeralston paid in assessed taxes three pounds nine shillings; Bramber, sixteen pounds eight shillings and ninepence; and Bishop's Castle, forty pounds seventeen shillings—Marylebone paid two hundred and ninety thousand three hundred and seventy-six pounds three shillings and ninepence; Tower Hamlets, one hundred and eighteen thousand five hundred and forty-six pounds; Lambeth, one hundred and eight thousand eight hundred and forty-one pounds; Manchester, forty thousand and ninety-four pounds; and Birmingham twenty-six thousand nine hundred and eighty-six pounds.

The parliamentary representation of Scotland was even worse than that of England and Wales. The county franchise was chiefly limited to the few landholders and purchasers of 'superiorities'—the latter class being often without dependence of property or residence; while the burgh suffrage was limited to self-elected town-councillors; consequently neither population nor property was represented by the constituencies, but merely the smallest local interests. In 1823, the whole number of voters was less than three thousand, and in no county were they more than two hundred and forty; and in one they only numbered nine, of which insignificant number, some were fictitious or non-resident electors, and without property. Even in 1831, the entire number of Scottish voters did not exceed four thousand. We are informed that 'at an election at Bute not beyond the memory of man, only one person attended the meeting, except the sheriff and the returning officer. He of course took the chair, constituted the meeting, called over the roll of freeholders, answered to his own name, took the

vote as to the preses, and elected himself. He then moved and seconded his own nomination, put the question as to the vote, and was unanimously returned!

The constituencies of Edinburgh and Glasgow were so insignificant that each town had only thirty-three electors. With such a limited and ridiculous suffrage as Scotland then possessed, this part of Great Britain, with more than two millions of intelligent, laborious, and peaceable people, was practically disfranchised, as the members for all its counties and boroughs were returned by political patrons, who, by generally making terms with ministers, and by the exercise of considerable tact, caused almost the entire representation of Scotland to be secured by the friends and agents of the government. Lord Cockburn, in his *Memoirs*, states that 'the election of either the town or the county member was a matter of such utter indifference to the people, that they often only knew of it by the ringing of a bell, or by seeing it mentioned next day in a newspaper; for the farce was generally performed in an apartment from which, if convenient, the public could be excluded, and never in the open air.' Where there were districts of burghs, each town-council elected a delegate, and the four or five delegates chose the member; 'and instead of bribing the town-councils, the established practice was to bribe only the delegates, or indeed only one of them, if this could secure the majority.'

With regard to Irish constituencies, while several of the smaller nomination boroughs were abolished on its Union with Great Britain in 1801, many were suffered to remain under the patronage of noblemen and landowners; and more important constituencies were subject, by limited laws of franchise, to the same disadvantage. Thus, the right of voting in Belfast, in Carlow, in Wexford, and in Sligo, was vested in twelve self-elected burgesses; and in Limerick and Kilkenny, it was enjoyed by the corporation and the freemen. In the counties, the return of members was secured by the influence of the landed families; and to extend this power, the landowners subdivided their estates into an enormous number of forty-shilling freeholds, which, according to the law of Ireland, were created without the possession of property, and the freeholders' votes were considered the absolute right of the owners of the land. The result, therefore, was that, after the Union, more than two-thirds of the Irish members were returned to the Lower House of parliament by about fifty or sixty territorial magnates, and not by the people of Ireland.

The sale of seats in the House of Commons for English and Welsh boroughs was another curious circumstance in connection with elections. It appears that when members were returned by a small but independent body of electors, their personal votes were obtained by bribery; but when proprietors or corporations had to return representatives, the seats were often purchased direct. The sale of boroughs became a well-known system during last century; and the right of property in these constituencies was admitted, and capable, like any other property, of sale and transfer. Thus, the borough of Orford, which belonged to the Crown, was, at the request of Lord Hertford, transferred to him by the ministry of Lord Chatham; while Sudbury, which was detested for

its corruption, advertised itself for sale until it was disfranchised. If the government required a seat for a particular person, the sitting member was bought out at a price agreed on between them. At the general election of 1768, parliamentary seats were bought by the Treasury, and by leading noblemen for their followers, as well as by speculators and gentlemen who otherwise could not become members of the House of Commons. The general price of boroughs was said to be raised at that time from two thousand five hundred pounds to four or five thousand pounds, by the competition of the East and West Indian merchants. The representation of the borough of Ludgershall was sold for nine thousand pounds by its owner, the celebrated George Selwyn. Even agents or 'borough-brokers' were commissioned by some of the smaller boroughs to offer them to the highest bidder.

To purchase a seat in the House of Commons was frequently the only means by which an independent member could get returned; and hence it was that the virtuous Sir Samuel Romilly, who had declined a seat from the favour of the Prince of Wales, justified his purchase of the seat for Horsham from the Duke of Norfolk, on the ground that it secured his own independence and the interests of the public. The sale of seats had become so regular and systematic, that in many instances, when candidates could not at once afford to pay the purchase-money, this was commuted into an annual rent, for their convenience; and the apology advanced for such dealings was that boroughs were usually disposed of to individuals possessing the same political views as their owners.

The existence of 'close' and 'rotten' boroughs had this one advantage, that they facilitated the entrance into the House of Commons of men of ability, who otherwise would not have been returned. Their introduction into parliament also afforded them a good opportunity of displaying their legislative abilities, and recommended them to be subsequently returned for much larger constituencies. It was on this account that Mr Burke and Mr Canning, who had shown their political talents while members for Wendover, were afterwards returned—the former for Bristol, and the latter for Liverpool.

Although the county voters in England and Wales were much under the influence of the great territorial peers and commoners, yet voting was far more liberal among them than in most cities and boroughs. As all the forty-shilling freeholders, comprising the county gentry and yeomanry, enjoyed the franchise, these constituencies were the most adequately represented.

In populous and in rising towns, freely chosen members were not returned to parliament so often as they should have been, these being the places most generally selected for the election of candidates of the government, as they abounded with revenue officers, who, till 1782, were parliamentary electors; and their votes, backed up by those of corrupt freemen, overcame the independent electors. Lord Rockingham stated that no less than seventy elections depended upon these petty government officials; while in one borough, one hundred and twenty out of the five hundred electors had obtained revenue appointments through the influence of one person.

Again, Sir Thomas Erskine May tells us that even in a few great cities, whose voters with popular rights of election could not be controlled, either by landowners or the government, and who were not under the influence of corruption, the vices of the election law were such that a popular candidate with a majority of votes might have to contend against such vexatious and oppressive obstacles as to prevent him obtaining the free suffrages of the electors. 'If not defeated at the poll by riots and open violence—or defrauded of his votes by the partiality of the returning officer, or the factious manoeuvres of his opponents—he was ruined by the extravagant cost of his victory. The poll was liable to be kept open for forty days, entailing an enormous expense upon the candidates, and prolific of bribery, treating, and riots. During this period, the public-houses were thrown open; and drunkenness and disorder prevailed in the streets and at the hustings. Bands of hired ruffians—armed with bludgeons, and inflamed by drink—paraded the public thoroughfares, intimidating voters, and resisting their access to the polling-places. Candidates, assailed with offensive and often dangerous missiles, braved the penalties of the pillory; while their supporters were exposed to the fury of a drunken mob.'

One of the most scandalous evils of elections is bribery. This was first systematically practised in the reign of Charles II., though it prevailed earlier; and the Revolution, which augmented the power of the Lower House of parliament, extended the scope of this vice. The price of votes varied according to their number. In some boroughs, it was as low as two pounds; and in others, it was about thirty pounds. This sum, said an apothecary of Ilchester on his examination, is the price of a voter at that place; and upon being asked how he knew this sum so accurately, answered that he attended the voters' families professionally, and his bills were paid at election times with the money. The electors of Grampound have been known to boast of receiving three hundred guineas each for their votes at one election. In contesting the larger boroughs, there was a good deal of work and drinking to go through; while in the smaller ones, the candidates sometimes never showed themselves, and an old pauper of the place was chaired round the town for form's sake!

There are several comical electioneering anecdotes, a few of which appeared in the *Quarterly Review* in 1857. When the Berwick freemen resident in London were going by sea to vote, the masters who commanded the ships in which they embarked have been known to take such electors to Norway, on account of such skippers being bribed to do so. The freemen of Ipswich appear also in the same way to have been taken to Holland. As the daughters of freemen at Bristol conferred the right of voting on their husbands, a trick devised at one closely contested election in that city was for the same woman to marry several men. When the ceremony was completed, and the temporary husband had duly recorded his vote, the two shook hands over a grave in the churchyard, and said: 'Now death us do part;' which was considered a divorce; after which the woman proceeded to qualify another husband at another church. At one place, bribes were given by a mysterious individual known as the 'Man in the Moon,' who approached at dusk in the evening, and

was at once met with the question: 'What news from the moon?'

'I'll lay you five guineas,' said a celebrated canvasser in Fox's contest of 1784, 'and stake the money in your own hands, that you will not vote for Mr Fox.' 'Done!' says the free and independent; and wins his bet and bribe. Another plan was to buy the voter's canary at a price which would have been far too much for a bird of paradise. When Sheridan contested Westminster, his opponent brought up his unpaid creditors to bully him on the hustings. They censured him for having bought pens at two guineas and a half per quart (to make sure of a voter), while he was neglecting their just claims against him; and they hooted him accordingly.

The cost of contested county elections in England was sometimes enormous, especially when they were political battles waged on account of the rivalry of great houses. The Duke of Portland is reported to have spent forty thousand pounds in contesting Westmoreland and Cumberland with Sir James Lowther, who must have spent quite as much. But by far the most costly electioneering contest ever fought in this country was that for the representation of Yorkshire in 1807, and has been called the 'Austerlitz of electioneering.' The candidates were Viscount Milton, son of Earl Fitzwilliam, supported by the Whigs; the Hon. Henry Lascelles, son of Lord Harewood, nominated by the Tories; and William Wilberforce, supported by the Independent party and the Dissenters. For fifteen days—which was the time limited by law for the election—it was continued with doubtful success between the two great political party candidates; but Mr Wilberforce headed the poll the whole time, and the election ended in his favour and that of Lord Milton. The number of votes polled were for Mr Wilberforce eleven thousand eight hundred and eight; for Lord Milton, eleven thousand one hundred and seventy-seven; and for the Hon. Mr Lascelles, ten thousand nine hundred and ninety. This celebrated contest is said to have cost the three parties nearly half a million of money. 'Not a vehicle of any sort was to be hired in the county long before the fifteen days' polling was over. Voters came up the river in heavily laden boats, others in wagons and on donkeys, while hundreds trudged on foot from all parts of the county.' The expenses of Mr Wilberforce were paid by public subscription; and so much public zeal was shown in favour of his character and election, that more than double the sum necessary for his election expenses was raised in a few days, and half of it was afterwards returned to the subscribers.

## MY LAST DETECTIVE CASE

### CHAPTER I.

I HAD been in the police so long at the time my story opens, that I was thinking of getting out of it; in fact, it was pretty well understood that at the end of the year I intended to apply for my pension. There was very little doubt of my getting it. After a certain number of years, you begin to feel that you have had almost enough—quite enough, perhaps—of public life, and so wish

to take it easy. I had not done badly while in the Force; for I was in comfortable, I may almost say independent circumstances. My house was my own—six good rooms, in a nice quiet neighbourhood, and we took no lodgers, except a man and his wife. My wife and I, with our servant-girl, were the only other inmates, so we were not overcrowded; indeed, I don't think I should have taken any lodgers, but that Mrs Nickham—I was Sergeant Nickham, detective attached to the Z division—complained of being dull and lonely when I was away, as I often was for days, or even weeks together.

The public are aware that a detective can never reckon on his time; for the awkward feature of our business is that you never can tell where your inquiries may lead you. Why, it once happened to me that I started for Wales to find a man. He had cleared out very cleverly when I got there; but I traced him back to London; and there was I living in a back street not far from my own house, dressed up as a costermonger, and wheeling a barrow of vegetables about all day, while my wife thought I was hundreds of miles off. Yes; and if I had not had a boy to help me, I should have been in a fix; for Mrs Nickham was talking to a friend at the door of this friend's house, when I went by; and I am blessed if they did not call me, and bought some small salad! Of course I sent the boy with it; but I never had such a near thing of it in my life. My story, however, has nothing to do with this dodge, which occurred at a much earlier period of my service; so I will merely say that I caught my man, and did very well by the capture.

My lodger's name was Hellip. He was something in the leather trade. I never exactly knew what he was; for it has always been a maxim with me to leave the detective outside my own door. I knew he had to make frequent journeys to Northampton, and occasionally had to go to France about his purchases or sales—that was pretty nearly all I knew about him. He was rather disposed to be intimate; but I never thoroughly cottoned to him, as the saying is, so we did not grow to any greater friendship than just a friendly footing as landlord and tenant. A capital tenant he was too, money ready to the day; while quieter lodgers than both he and his wife never entered a house.

In what I may call my district, but yet at a considerable distance from my house, in a respectable thoroughfare called Upper Broughton Street, there lived an old gentleman with whom I had some slight acquaintance. His name was Daryett; and having long been a resident there, his shrivelled, mean-looking, little figure, dressed in clothes of suitable meanness, was very well known; and his repute of being something of a miser, was well known also. I used to speak whenever I met the old gentleman; and as he was frequently accompanied by his niece, a Miss Rose Merry, I got to know them both.

There was not much doubt that the old party

was a regular usurer. To look at him, you would not have thought that he had a shilling in the world; but I had heard enough to know better; in fact, he was rather a notorious character in his neighbourhood. I used to feel sorry for the pretty girl, his niece, to whom he was always as sour and ill-tempered as possible; but she was a most amiable young woman, and bore it like an angel. I was quite pleased when I met her two or three times with a good-looking, respectable young fellow, evidently her sweetheart; and I thought that, after all, there might be some compensation coming for the life she was leading. However, Mrs Nickham told me one evening—how women hear all the news, I can't make out, but they *do* hear it—that old Daryett had found out about this young fellow, and was almost beside himself with rage. There was no harm in the girl taking a liking to a decent young spark; and young Brake—that was his name—was in very respectable employment as a clerk. But old Daryett would listen to no reason. He insisted on the girl giving him up; and when she refused to do so, he turned her out of the house at only a day's warning! It seemed that the young fellow had entertained some suspicion of what might happen, and had given notice at the registrar's—he dared not put up the banns in church, for fear Daryett should be told of it—so, when the explosion came, he was able at once to do the best thing possible for poor Rose, and marry her offhand. He had nothing but his earnings; she, in the circumstances, of course had not a guinea in the world; but others have married under the same circumstances, and done very well in the end. Mrs Nickham told me—and how she came to learn this also, puzzled me—that it was reported the old man meant to alter his will, and so carry his spite beyond the grave. He was just the old fellow I should have expected to be guilty of such conduct.

We were quite sympathetic about the young people; and I do believe that if any tolerable excuse had offered itself, Mrs Nickham would have gone to see how they got on. She did not do so, however; and we thought no more of them, till a few days after, when, just as I was getting ready to go round to the station and report myself—I was always on day-duty now, my time being so nearly up—a sharp knock was heard at the street door. It was only a single rap; but I felt certain it was for me. Somehow, you can generally tell when there is anything special coming, and the next minute one of our men presented himself.

'Well, Bingley, what's up now?' I said; for I saw he had something to tell me.

'I thought I would call in upon you, Mr Nickham,' replied the man, 'and let you know what has happened. There's been a burglary and murder in Upper Broughton Street—an awful affair.'

'Upper Broughton Street!' I repeated. I knew at once what was coming, without another word. 'You don't mean to say it is old Daryett?'

'I do indeed,' was the reply. 'The old fellow is killed by a blow on the head, so far as is known, and the house is robbed, but not of a great deal. It has only just been found out. I am going to let the inspector know; but I thought I would tell you as I went by, as I am sure they would be

glad if you would go up and give an eye to the place. Of course I left one of our men there.'

That was enough. I jumped up directly, and was off without a moment's delay to the spot.

It was just as I had been told. The old man had been robbed, and probably was killed in defence of his treasure. It is not necessary to give any particular description of what I saw, and I am glad of it; for in defiance of the popular taste which leads us to revel in every detail of a great crime or horrible event, however ghastly, I don't think such things furnish very good reading. I know, the more I saw of them, the less I liked them, and was glad when I was in the police to think I had very little to do with the Chamber of Horrors department. I am glad, therefore, to be able to compress this part of the story into a very limited space, and to find that it will be enough to refer to the evidence, without entering upon any account of what I saw or did when I got to the house.

After the departure of his niece, Mr Daryett had lived by himself, save for a deaf old house-keeper, who slept on the top floor. This woman was too far away to hear anything, even if she had not been deaf; and too deaf to have heard any moderate noise even in the next room. The thief, or thieves, had gained admission by a basement window, which was forced, and appeared to have gone straight to the old man's bedroom, as there was no trace of any other apartment having been visited. In this bedchamber was a safe, which had been opened with its proper key—found in the lock on the next morning. This key was always kept in the old man's pocket, from which it must have been taken; and it was naturally conjectured that the noise made in opening the safe door had awoke Daryett, who had been silenced, on the principle that dead men tell no tales. So far, it was like fifty other crimes which have passed without special notice. Yet there were some curious features in the business, which set people's tongues wagging; and a great many of those who knew old Daryett best, did not believe in the burglary at all, excepting as a blind.

The matter not being placed in my hands, I was able to hear a good deal of discussion about it, and it was strongly pointed out how little appeared to have been stolen. The safe door was opened, as said; but no attempt had been made to force open the small locked drawers inside, the keys of which were hidden in a secret place in the safe itself. Professional thieves would not have neglected these, and indeed some hundreds of pounds were found in these drawers; so this led many persons to say the robbery was but a feint. A number of bills and promissory notes were found in the usurer's safe, all in the greatest disorder. Whether any had been removed, it was impossible to say, as no one knew what had been there. Some jewellery was certainly gone; also two or three valuable diamond rings, and a curious old-style gold watch, the face studded with pearls.

This last information was obtained from Mrs Brake, who had seen the articles; but after the first day or so, our people did not ask her any questions, as many persons began to whisper that she, or rather her husband, was the guilty party.

It was plainly declared that the young couple had committed, or caused to be committed, this murder, partly in revenge, but chiefly to prevent the old man from altering the will which he was supposed to have made in favour of the girl. Those who argued thus, declared the robbery to be but a feint to divert suspicion, and to give the crime the appearance of a commonplace ordinary murder.

Others, however, thought differently, and among them was the gentleman who took the direction of affairs into his hands, a Mr Prinley, who had married Daryett's sister, although he had not seen the churlish old man for twenty years. He found a great deficiency in the property. What it was that was gone, it was not easy to say, so slovenly kept were Daryett's accounts, although he doubtless understood them well enough. The accountant engaged found references to a large sum of money, which did not appear to be invested; nor could he find it to be out on loan, as was the case with much of Daryett's capital. Several very recent entries, so far as they were intelligible at all, seemed to show that this amount was about to be used in some operation; but of the money itself—about two thousand pounds—there was no trace. The brother-in-law was strongly of opinion that Mr Brake was the culprit, and had secured this booty, having some means of knowing that the money was in the house. But the accountant did not agree with this opinion. The latter thought the amount was represented by some form of security, bill, or scrip; but from the extraordinary muddle and unintelligible signs in the old gentleman's memorandum book, which was the only record found, it was impossible to decide with certainty. At anyrate, if the poor old creature had been murdered to prevent him from making a will, the crime had been thrown away, for a will was produced by his solicitor, duly executed and attested, and all that sort of thing, dated some two years back, which left all his property to a nephew, who was, it appeared, in Australia, quite passing over Mrs Brake, who had not, after all, lost much by her quarrel; although the cunning old fellow, who must have been a very bad man at heart, had been continually dropping hints as to what great things he meant to do for her. I used to hear a good deal about this matter among our people, who had almost made up their minds, two or three times, to arrest Mr Brake on suspicion; they had no doubt that he was the man. But there was such a total absence of evidence to prove he had been near the house on the night, that he was left alone for the present.

Up to this time I had nothing to do with the inquiry; but Mr Prinley being anxious to get back to Cumberland, where he lived, as soon as he could, left the accountant in charge of everything; but before he went, he called at Scotland Yard, and expressed his wish that the investigation should be kept up. He said he had a strong impression that the guilty parties were already suspected, and could be detected; while as for expenses, the accountant had authority to defray all charges. This was quite enough, as regards the latter; for the authorities were referred to one of the most respectable firms in London. It was decided, after a consideration of all the circumstances, that an officer thoroughly familiar with

the neighbourhood and its residents would be better for the duty than a detective from the head office, so I was naturally pitched upon by the superintendent, as I was on the detective staff of our division, and was almost the oldest constable in our district. So this is how I came to have charge of the Upper Broughton Street mystery. It was not a very promising case for me, as the inquiries already set on foot had utterly failed, and there was really hardly anything to go upon.

The first thing I did was to make some inquiry as to whether Mr Prinley might not have done it himself. Mind, I did not think this was altogether likely; but it was as likely as anything else I could see. His wife was the old man's nearest relation; and he might have been as anxious to prevent a new will from being made, or a new companion being found to succeed Mrs Brake, as any one else could be. But it was not he who did it—a very little trouble satisfied me as to that; and the question still remained: Who could it have been? Not that I waited until Prinley was clear, before I looked about me in other directions. No; that is the fault of too many of our men, and often have they lost a good chance by it; but I was always careful not to waste time.

As it appeared likely that I might have to call upon Mr and Mrs Brake at a more advanced stage of the proceedings, I did not wait upon them; but I got hold of the housekeeper, whom I have mentioned as being deaf, and sleeping on the top floor of old Daryett's house. I found that he had left her fifteen pounds a year—the miserable old screw! Why, she had lived in his service for forty-three years! She was now 'living independent on her property,' as she told me, with her son. The old woman was terribly deaf, and a little childish, so I could not make much out of her. The son was a hard-working fellow, whose wife took in washing, he turning the mangle, and fetching or taking home the clothes. An ordinary detective would have suspected him, and quite naturally too; nothing would have been more correct in the ordinary course of business; but I knew Bill Jenkins—that was his name—too well and too long to think that it was possible for him to be in such a business. He knew me too; so, when I called upon him, and took him into the tea-gardens of the Alderman's Castle, which are as quiet, excepting on Sundays, as if they were in some country village a hundred miles out of town, he knew I wanted information about the Daryett murder, before I had opened my lips on the subject. He might have been a little nervous at first; but I took care to make him understand that he and his people were free from all suspicion. If I had not done so, he would have been too anxious to clear himself, to chatter freely over his gin-and-water, which is what I was anxious for him to do.

As Bill Jenkins had often been employed to do odd jobs at Mr Daryett's, and was there pretty nearly every day, he could tell me what I wanted to know almost as well as his mother could have done, especially as the old lady had talked to him about nothing but the murder—except it was her property—ever since she had moved to his house.

First of all, I asked him concerning these young people, Mr and Mrs Brake—what did

he know about them? He spoke very highly of the young couple, and was quite angry at the idea that either of them could have had anything to do with such a deed. He said that Mrs Brake was much distressed at the death of the ill-tempered old fellow who had been her tyrant so long; although Bill honestly confessed that he could not understand why she should be sorry.

There were no other relatives that he knew of, who came to see the usurer; but there were plenty of people who came to borrow money, or to pay it back. He did not know many of these, but there was one man whom he should know—a man whom he had never liked, and had always looked upon as dangerous. I naturally asked him why he said this, and was at first disappointed to hear him reply: 'By his look, Mr Nickham, and his uncivil way of speaking to a fellow.' This was not much to go upon, in a murder clue; but as he seemed to be uncommonly full of this man's bad qualities, I let him go on. It is always the best way; you can never tell what will come out. Partly from what he had seen, and partly from what his mother had told him—anything was evidence with me, although it might not have passed at the Old Bailey—I found that this man had been for a long time in the habit of visiting Mr Daryett as a customer; and the housekeeper had taken it into her head, from something she had heard—through Mrs Brake, I suppose—that he was the greatest customer of all. What business he had actually transacted, the old woman of course did not know; but shortly before the death of Daryett, she noticed that this man had been much more frequent in his visits, while the old gentleman had shown a good deal of ill temper towards him. At one time, he could have access to Daryett at any time of the day, and there was always a deal of laughter and talking during the interview; the visitor, too, often sent out for wine, which, it is hardly necessary to say, was never kept in the house. Recently, however, there had been a great change. Daryett would sometimes go out when he knew the other was coming, as Bill Jenkins had himself heard the latter complain; but he would never go away without seeing the old man, although he several times had to linger about the neighbourhood for hours to do so. Sometimes again, even when Daryett was at home, he would keep the visitor as long as possible before seeing him; yet urgent as his business must have been, this man was never seen at the house after the day of the robbery. The worst of it was that Jenkins did not know his name, address, or what his trade was; nor did his mother, whom I questioned, in spite of her deafness; for the reader must not suppose I got everything straight off, just as I am now repeating it, in one conversation.

If I could have obtained sufficient trace of this person to lead me to him, I should certainly have tried in that quarter; for there was something suspicious in his constant visits and their sudden stoppage. Many a smaller thing than that has been cut into the first step of the ugly ladder which leads to the gallows. Beyond telling me that this was a broad-faced, puffy man, with small eyes, and a set smile or grin on his face, which made him look very ugly, I could get no description of him; so, for the present, there was not much hope of his identification. Yet—it was

very odd—although such a vague description might apply to five hundred different persons, it haunted me. It seemed as though at some time I must have dreamt of such a man; but dreams don't answer with policemen.

### THE PRICELESS PEARL.

A CHILD of Italy, in convent reared,  
Medora sits beneath the orange-trees,  
Musing on Life, and Love, and claims of Duty.

The picture, framed by crumbling masonry walls,  
Is passing fair, and breathes a deep repose,  
That's lulled, not broken, by the fountain's plash  
And voice of pigeons cooing to their mates;  
While orange-blossoms give out their luscious scents,  
And well-nigh overpower the fragrant breath  
Of thyme and lavender and healing herbs.

Oft will their mingled sweets recur to her  
In after-days of fuller, freer life,  
And make the convent garden bloom again  
In her mind's eye, who now so meekly sits  
Among the flowers—the fairest of them all!  
Her round arms clasp the hoary dial's stem  
In mute unconscious symbolism—the while,  
All fancy-free, she hearkens to the hum  
Of murmuring bees—then ponders how it is  
They seem so loath to leave their honeyed toil—  
Till their unrest imparts itself to her.

Long had she dwelt content among the nuns,  
Who fondled her as never child before;  
Their gentle rule had never fretted her,  
In spite of all its primness and restrictions;  
And, cherished by their kindest motherhood,  
The orphan'd girl had almost quite forgot  
The outside world where once she had her home.

But, lately, she had seen her former nurse—  
A peasant-woman from Valdarno's side—  
And heard such talk of sickness and distress,  
That all the woman woke within her soul,  
And made her yearn to comfort and relieve.  
'Oh, would the Mother only let me go!'—  
She said to Sister Anna, who had charge  
Of her—to dress more dainty fare for nurse,  
And cheer her for awhile with lute and song,  
Then I would seek again your sheltering walls  
Till, wholly vowed, I might with full consent  
Go forth a minist'ring Sister of the Poor.

'This will not do,' the timid Anna thought.  
'Tis thus it oft begins. I shall be blamed.  
Unless I check this rising wish, my bird  
Will beat its wings against the bars, and pine  
For flight. How it would grieve the Sisterhood  
To lose her, and how anger all her kin  
Who have their private ends to serve.' So she  
Replied with caution: 'Child, most dear than art  
To all of us; we would not see thee sin,  
By seeking thine own wayward will to please.  
List, while I tell to thee a parable  
About a Princess and her suitors five,  
That my confessor taught me, holy man;  
A poet he, who knew the human heart.

'This maid, of royal birth, possessed a Pearl  
Of priceless worth—a treasure that would last,  
So saith the Canticle, for aye unspent,  
If she should wisely choose her bosom's lord.

'First came a suitor who had goodly store  
Of dainty meats, and sugar-plums, and fruits.  
'Be mine,' he said, 'and I will make a feast  
The richest ever spread. My all I'll spend  
Upon the banquet.' Wisely she replied:  
'Good sir, after the feast might come a fast;  
Satiety at all events would come.  
No; I'll not risk my all upon a feast,  
However rich. My hand is not for thee.'

'Next came a youth who had command of all  
The perfumes of the Sunny South. "Fair maid,"  
He said, "if you'll be mine, you will I take  
To palaces enchanted, where the scent  
Of oleanders, myrtles, roses, all  
Would count for nought—such airs of Araby  
Shall ever wrap thee round and hilt thy sense."  
'Fair Prince," the maiden said, "such sweets  
would cloy.

I must have more than perfumes, ere I give  
My never-ending source of wealth in fee."

'A great musician was the next that came.  
"Such music ne'er was heard, as I can give  
To her," he said, "that will be wholly mine.  
Put all thy stores at my disposal; thou  
Shalt have such thrilling festival of sound  
As never yet to mortal ear was given.  
No strain that thou hast ever heard, begot  
By touch of master's hand on organ, harp,  
On lyre, or lute, can give the faintest hint  
Of what I will provide for thee." Then she:

"Thanks, gentle sir; but when the concert's done,  
I might be weary of sweet sounds, and much  
Repent me to have squandered all the store  
That should supply resources infinite."

'So he, too, went disconsolate away.  
Then her fourth suitor came—a painter, he  
With eyes to see the beautiful, and hand  
To put it on the canvas, like to his  
Who made the glorious altar-piece within  
Our chapel there—where, in the very air  
Circling our Holy Mother with the Babe,  
Our mortal eyes are able to discern  
Those heavenly forms his eyes had grace to see,  
That ever minister to earthly needs,  
Though all unseen by grovellers of the clay.  
'Fair one," he said, "give all your wealth to me,  
And I will paint you such a pictured scene  
As shall make Fancy's kingdom open all  
Her palace gates, for you to enter in,  
And dwell in it for aye." "A goodly gift  
Indeed were this," the Princess said. "But what  
If bandit bold should break into our tower,  
And snatch away the wondrous work of art,  
Before your spirit's dream had writ itself  
On canvas? No! I will not so bestow  
My priceless Pearl."

'Then came the fifth, a knight—

A dainty carpet-knight indeed was he—  
Fastidious beyond belief. "Princess,"  
He said, "this cruel rugged world is all  
Unfit for one as sensitive as thou.  
Give me the empire over all your store,  
And I will lap you round with luxury!  
Caressed with unguents and cosmetics rare,  
Your dainty limbs shall never touch the ground;  
And I will clothe you in such soft array  
As you have never dreamed of. Silken stuffs,  
Velvets of lustrous pile, and satins smooth,  
Shall carpet every path you tread, and clothe  
The very walls around you—till all noise  
Be hushed to music—and the clash and clang  
Of household labour sound like cooing doves."

Replied the maid: "Belike, such calm would lull  
Me to a sleep so deep that I should ne'er  
Awake enough to know how blest I was!

Thus should I spend my priceless Pearl for nought."  
'So he, too, was dismissed.' 'And rightly too,'  
Medora quick replies. 'Unmanly, he—  
Unworthy to be any maiden's guide!'

'Now quickly hear the rest,' said Anna, 'ere  
The vesper-bell call us to evening prayer.  
The issue and the moral of my tale  
Are yet to come. 'Twas not the will of heaven  
The maid should die unwed. Oft did she muse  
Upon the wasted wealth fast looked in that  
One solitary Pearl, and long to give

It to a worthy knight. At last came one  
Who sought her for herself. As to her Pearl,  
He only wanted it more brightly set  
And burnished—for he sought not hers, but her.  
She was to keep the pearl, her own, to all  
Eternity. But when the maiden saw  
His nobleness, and how he was the chief  
Among ten thousand, though with visage marred  
In service of the suffering and the weak,  
She could not choose but love him loyally,  
And instantly besought him to accept  
The Pearl, and use it as he would! So she  
Became his bride, his blessed bride.—Thus ends  
The tale, my child. Now, tell me, can you read  
The riddle?—No? Then I must tell it you.  
It shadows forth my life or yours—for we  
Are daughters of a king—the King of kings!  
And hear about a priceless Pearl within—  
The never-dying Soul. So 'twas explained  
By Father Luigi, when he catchised.

'That's well, my child; I'm glad you cross yourself  
Discreetly ere you ask who were the Five  
That sought her first, seeking to dominate  
Her inmost soul. They were the Senses Five:  
We taught you to enumerate in school.  
There's *Taste*, that woos us hotly first of all,  
And fain would make us, Eau-like, forego  
Our birthright; *Smelling*, which allures us, too,  
With joys of sense; *Hearing*, that would engross  
The soul, and deafen it to the still voice  
Of Conscience; *Sight*, that fain would seize the  
realm

Of Faith; and *Touch*, a holder despot still.  
'I mind me well. But tell me of the Knight  
Who sought her for herself,' Medora said.  
'That will I, sweet my child, at fitting time;  
For it is He who woos His church to-day  
To come apart and be His chosen Bride.  
Now peace, Medora; yonder passes one  
Who rings the bell for silence to prevail  
Until the vesper-bell shall sound for prayer.'

Suns rise and set—Matins and Evensong,  
Terce, Sext, and Nones, and Compline mark the  
hour

With chant and prayer continual; but the maid  
Cannot forget her longing for her nurse  
And all the simple peasant-folk, whose days  
Of toil and sweet domestic charities  
Had been familiar to her infancy.

At last she brought her courage to the point  
Of begging the dear nuns to let her go  
And see the foster-mother whom she loved.  
They said her Nay at first; but when they found  
Her hunger grew, and would not be appeased  
Without the food it craved—but mastered her,  
Wasting her rounded limbs, till these became  
A parody on theirs—they let her go,  
'Neath Sister Anna's careful guardianship,  
To pastures of Valdarno, there to take  
The breath of kine, and milk of mountain goats.  
Oh! what a joyous greeting waited them  
That summer's evening when they first arrived!  
Brigitta's time-worn face took lines of joy,  
That crossed the many furrows Care had ploughed—  
Effacing them like words on palimpsest—  
As they three sat beneath the olive-trees  
And watched the fireflies floating dreamily  
Above the indescribable blue-green  
That paints the young blades of the rising corn,  
Brigitta's grandchild chasing them the while,  
Filling his busied hands with harmless flame.

Sure evening is more fair in Italy  
Than any other land! The deep-hued sky  
Itself seems vaster, nearer to us, yet  
More far, than elsewhere, and each star to pulse

In unison with Nature's mighty heart!  
While gentle airs, laden with precious scents  
Of jessamine and myrtle, fan the cheek,  
And waft the plash of fountains to the ear,  
In concert with the song of nightingales!  
'The Niobe of Nations' at this hour  
Still throbs with poetry and passion.

Medora felt it so; though weeks had passed  
Since Anna's tale had become part of her,  
And given her tender conscience much ado  
Lest she should fail to curb each tyrant Sense,  
And let it grow too masterful. 'Twas good  
To see the girl, who soon became the pride  
Of the hill-side—now dressing macaroni  
After a dainty fashion of the nuns,  
Now weaving garlands of the wayside flowers,  
To place on new-made graves—a solace now  
For fretful infancy or careworn age—  
Chasing away their sense of wrong with sound  
Of lute or song; but oftener as the nurse  
Of sick or sorrowing wife or ailing babe.

One morning she was sitting at the door,  
An infant in her arms, who sweetly smiled  
On Sister Anna standing by her, when  
There passed that way two noble strangers—one,  
A man of fifty years or thereabout,  
Who owned the smoke-hued olive-groves around;  
The other but a youth, though aged and blanched  
By thought and pain and hunger. He had known  
An Austrian dungeon's horrors, deep and dark;  
Had been with Garibaldi many a day,  
Now fighting, now exhorting, now in prayer  
By dying bed; or, oftener still, 'mid sick  
And wounded, plying all the leech's craft,  
Which he had studied ardently within  
The schools of Padua.

As now the two  
Turned round a vineyard wall and came in sight  
Of Anna and Medora and the babe—  
'A sacred picture that,' Count Carlo said.  
'Those figures in that doorway bring to mind  
An altar-piece of Raphael's I have seen,  
Where St Elizabeth admiring stands—  
Just so—beside Our Lady and the Babe!—  
What say you, 'Vico? Do you see it too?'  
But 'Vico answered not; he had no tongue!  
All eyes was he—eyes in which rapture glowed  
Like those of saints that catch the light of heaven.  
He answered not; but thought within himself:  
'There sits the destined help-meet given for me,  
And through me for my Italy!' And then,  
With all the beautiful unconscious craft  
That lovers ever have been wont to use,  
Bethought him of Brigitta's aches and pains,  
And wondered if the wound were wholly healed  
That he had dressed for her when last he came  
At olive-gathering.

What need is there  
To linger o'er the old familiar tale,  
The age-long, world-wide theme of young romance.  
With all its varying preludes, and its yet  
More varying cadences? Suffice to say,  
That ere the tender blades of summer corn  
Had changed their blue-green stoles for robes of gold,  
There came a day when sweet Medora gave  
Her heart to one who sought her for herself,  
And placed—in beautiful joint guardianship—  
Her Pearl with his, where it long time had lain  
Within the secret place of the Most High.

Again the scene is changed: the canvas shows  
Another picture—for the land is free!  
Patriots have bled, mothers and wives have wept,  
But sorrowed with a sorrow full of Hope.

Medora, in her happy motherhood,  
Has proffered kindly arms to orphan'd babes  
And tottering age, as in her girlhood's morn.

To-day, her pleasant villa opens its gates  
To shelter two poor nuns, who found no home  
To turn to when their convent was suppressed  
By the new government. Oh! with what pride—  
Pure mother-pride—she shows her prattling babes  
To Sister Anna, standing there in all  
The helpless bashfulness of childhood, though  
Without its grace.—'What think you of your kin?  
Dear Sister Anna—of these stately boys?'  
She says, exultant, to her childhood's friend.  
'Your kin they must be, surely, dear, since you  
And I are Sisters!'

So indeed they were;  
Each doing homage to the highest that  
She knew, according to her light.

Again  
'Tis eve. Once more she sits, as when we saw  
Her first, beneath the shade of orange-boughs,  
That bear at once rich fruit and fairest flower;  
But, as she ponders now the claims of life  
And Love and Duty, she no longer deems  
Them rivals in God's beauteous world, that teems  
With joy for every soul—but separate rays,  
Proceeding from the Father of all Light,  
That blend in brightest, rosiest radiance, where  
His presence gilds the pure white light of Home.

MARY JEAFFERSON.

#### SOME EASTERN PARABLES.

A STORY illustrating an idea clings to the memory, and influences the life, where it could find no entrance if it came before the mind in an abstract form. That is why we all love parables and find them such sure teachers. The selections of Eastern parables we propose giving are so full of significance and practical instruction, that they will be found as useful as we hope they may prove entertaining.

That there are more ways than one of seeing everything, is shown in the parable of the tiger and the man, who were both looking at a picture, in which the man was drawn as victorious and the beast subdued. The man said to the tiger: 'Dost thou see the bravery of the man, how he has overcome the tiger?' The tiger gave answer: 'The painter was a man. If a tiger had been the painter, then the drawing would not have been in this manner.'

To people who are fond of vying with their neighbours, regardless if they can afford to do so or not, the following is a capital hint. 'An ass and a camel were the best of friends. One day they were out for a walk together, when they came to a river. The camel proceeded to cross the river, which was deep. When half-way over, he called to the ass, who still stood on the bank, to follow him. "No; thank you," said the ass. "It may be all very well for you; but don't you see that what you can cross, would drown me?"'

Rochefoucauld says: 'How can you expect a friend to keep your secret, when, by telling it to him, you prove that you are incapable of keeping it yourself?' To beware of how you confide in your friends, is given in the tale of a miser, who said to his friend: 'I have now a thousand rupees [one hundred pounds], which I will bury out of the city; and I will not tell this secret to

any one besides yourself.' They then went out of the city and buried the money under a tree. Some days after, the miser going alone to the tree to see if his money were safe, found it had disappeared. At once he suspected his friend; but he dared not question him, as he was sure that he would never confess it. So he had recourse to this stratagem. Going to him, he said: 'A great deal of money is come into my hands, which I want to put in the same place. If you will come to-morrow, we will go together.' The friend coveting the larger sum, replaced the smaller. In the meantime, the miser went and found it, and having secured his money, he determined never again to confide in a friend.

To people who in rash moments wish themselves dead, comes this parable, to show them that if taken at their word they would soon retract, and plead for life. 'A certain feeble old man had gathered a load of sticks, and was carrying it home. He became very tired on the road, and flinging down his burden, he cried out: "O Angel of Death, deliver me from this misery!" At that instant, the Angel of Death, in obedience to his summons, appeared before him, and asked him what he wanted. On seeing the frightful figure, the old man, trembling, replied: "O friend, be pleased to assist me, that I may lift once more this burden upon my shoulder; for this purpose only have I called you!"'

One of the kings of Persia sent a skillful physician to the prophet Mohammed. After remaining some years in Arabia without any one making trial of his skill as a physician, he went to Mohammed, and complained, saying: 'They sent me to dispense medicine to your companions; but to this day no one hath taken notice of me, that I might have an opportunity of performing the service to which I had been appointed.' Mohammed replied: 'It is a rule with these people never to eat until they are hard pressed by hunger, and to leave off eating whilst they have a good appetite.' The physician said: 'Ay indeed, this is the way to enjoy health.' He then made his obeisance and departed.

To those who are full of professions bearing no result, the following parable comes home. 'A horseman went to a city, and hearing that there were many thieves in that place, said to his groom at night: "Do you sleep, and I will keep watch, for I cannot rely on you." The groom answered: "Alas! my lord, what words are these! I cannot consent to be asleep and my master awake." In short the master went to sleep, and three hours afterwards awoke, when he called out to the groom: "What are you doing?" He answered: "I am meditating how God has spread the earth upon the water." The master said: "I am afraid lest the thieves come and you know nothing of it." He replied: "O my lord! rest satisfied; I am on the watch." The horseman went to sleep again, and awaking at midnight, he called out: "Hollo, groom! what are you doing?" He answered: "I am considering how God has supported the sky without pillars." To which the master replied: "I am afraid that amidst your meditations the thieves will carry away the horse." "Ah, my lord!" said the groom, "I am awake. How can the thieves come?" The cavalier again went to sleep, and an hour of night remaining, he awoke, and asked the groom what he was doing.

"I am considering," said the groom, "since the thieves have stolen the horse, whether I shall carry the saddle on my head to-morrow, or you, sir!"

A rather novel view of the relations of the rich towards the poor is given in the story of a very poor man who went to a very rich man and said: 'We are two sons of Adam and Eve; therefore we are brothers. You are very rich, and I am very poor; give me a brother's share.' The rich man gave to the poor man one cowrie—the smallest piece of money, a tiny shell. The poor man said: 'O sir, why do you not bestow upon me a brother's share?' To which the rich man replied: 'Be content, my good friend; if I give all my poor brothers one cowrie each, I shall not have any remaining.'

Almost all the literatures of Western nations contain humorous or sarcastic productions ridiculing the pretensions of those wives who wish to lord it over their husbands, and the Oriental literatures strike at the same foible. Here is a story from Mr Ralston's Russian Folk-tales, which mostly partake of an Oriental character. A certain woman was very bumptious. Her husband came from a village council one day, and she asked him: 'What have you been deciding over there?'

'What have we been deciding? Why, choosing a Golova' [that is, a mayor, or elected chief].

'Whom have you chosen?'

'No one as yet.'

'Choose me,' says the woman.

So her husband, desirous of giving her a lesson, went back to the council, and told the elders what she had said. They immediately chose her as Golova. Well, the woman got along, settled all questions, took bribes, and drank spirits at the peasants' expense. But the time came to collect the poll-tax. The Golova couldn't do it—wasn't able to collect it in time. There came a Cossack, and asked for the Golova; but the woman had hidden herself. As soon as she learnt that the Cossack had come, off she ran home.

'Where, oh, where can I hide myself?' she cries to her husband. 'Husband dear! tie me up in a bag, and put me out there where the corn-sacks are.'

Now, there were five sacks of seed-corn outside; so her husband tied up the Golova, and set her in the midst of them. Up came the Cossack and said: 'Ha! so the Golova's in hiding.' Then he took to slashing at the sacks one after another with his whip, and the woman to howling at the pitch of her voice: 'Oh, my father! I won't be a Golova, I won't be a Golova.' At last the Cossack left off beating the sacks, and rode away. But the woman had had enough of Golova-ing; from that time forward she took to obeying her husband.

We all know what a degrading thing avarice is—how it benumbs a man's finer instincts, and lowers and degrades his better nature. More especially is this the case if this undue love of money has developed within a man a want of scrupulous honour as to how he comes by his money, so that he but gets it. An Eastern parable illustrates this. A Russian priest knew that a moujik, or peasant, had come upon buried treasure in the shape of a pot of money; and the priest, being excessively avaricious, determined

that he should get possession of this treasure. So he killed one of his own goats, and took off its skin—horns, beard, and all complete; and having pulled the skin over himself, he told his wife to bring a needle and thread, and fasten it up all round, so that it might not slip off. In this guise he went to the moujik's cottage at dead of night, and began knocking and scratching, when the peasant jumped up and cried: 'Who's there?' 'The Evil One!' replied the priest; and demanded that the moujik should at once give him back the pot of money he had found. The peasant looked out of the window, and seeing the goat's horns and beard, he was certain his visitor was none other than he represented himself to be; and in great terror, he seized the pot of gold, carried it outside, and flung it on the ground. 'I've lived before now without money,' said he, 'and now I'll go on living without it.' The priest seized the money and hastened home. 'Come,' said he to his wife, 'the money is in our hands now. Here, put it well out of sight; and take a sharp knife, cut the thread, and pull the goat's skin off me before any one sees it.' She took the knife, and was beginning to cut the thread at the seam, when forth flowed blood, and the priest began to howl: 'Oh, it hurts, it hurts! don't cut, don't cut!' She began ripping the seam open in another place, but with just the same result. The goat's skin had united with his body all round. 'And all that they tried,' adds the legend, 'all that they did, even to taking the money back to the old man, was of no avail. The goat's skin remained clinging tight to the priest all the same. God evidently did it to punish him for his great greediness.'

This excessive love of money is frequently the subject of rebuke in the parables and legends of the Orientals. It is stated, for instance, of the inhabitants of the pagan city of Troyan, that they 'did not believe in Christ, but in gold and silver.' 'Now,' the legend goes on to say, 'there were seventy conduits in that city which supplied it with spring-water; and the Lord made these conduits run with liquid gold and silver instead of water, so that all the people had as much as they pleased of the metals they worshipped, but they had nothing to drink.' After a time the Lord took pity upon them, and there appeared at a little distance from the city a deep lake. To this they used to go for water; only, the lake was guarded by a terrible monster, which daily devoured a maiden, whom the inhabitants were obliged to give to it in return for leave to make use of the lake. The favour of St George was however propitiated by the people, and he was induced to rid them of the monster. They were then converted to Christianity.

The duty of helping and befriending the unfortunate is sometimes taught in these parables at the expense of the good character of certain of the saints. Thus, in one of the stories, a peasant is driving along a heavy road one autumn day, when his cart sticks fast in the mire. Just then St Kasian comes by.

'Help me, brother, to get my cart out of the mud,' says the peasant.

'Get along with you!' replies St Kasian. 'Do you suppose I've got leisure to be dawdling here with you!'

Presently, St Nicholas comes that way. The

pensant addresses the same request to him; and he stops and gives the required assistance. When the two saints arrive in heaven, the Lord asks them where they have been.

'I have been on the earth,' replies St Kasian; 'and I happened to pass by a moujik whose cart had stuck in the mud. He cried out to me, saying: "Help me to get my cart out!" But I was not going to spoil my heavenly apparel.'

'I have been on the earth,' says St Nicholas, whose clothes were all covered with mud. 'I went along that same road, and I helped the moujik to get his cart free.'

Then the Lord says: 'Listen, Kasian! Because thou didst not assist the moujik, therefore shall men honour thee by thanksgiving only once every four years. But to thee, Nicholas, because thou didst assist the moujik to set free his cart, shall men twice every year offer up thanksgiving.'

'Ever since that time,' says the story, 'it has been customary to offer prayers and thanksgiving to Nicholas twice a year, but to Kasian only once every leap-year.'

One of the most beautiful stories in Oriental, or perhaps any literature, whereby we are taught that no human creature is exempt from affliction and sorrow, is told in the life of Gautama, the founder of the Buddhist religion. There was a young woman, the story runs, who had been married early, as is the custom in the East, and had a child while she was still a girl. When the beautiful boy could run alone, he died. Her sorrow for a time deprived her of reason; and in her love for her dead child, she carried it from house to house of her pitying friends, asking them to give her medicine for it. A Buddhist convert, thinking 'she does not understand,' said to her: 'My good girl, I myself have no such medicine as you ask for; but I think I know of one who has.'

'Oh, tell me who that is?' cried the girl.

'The Buddha can give you medicine; go to him,' was the answer.

She went to Gautama; and doing homage to him, said: 'Lord and master, do you know any medicine that will be good for my child?'

'Yes; I know of some,' said the Teacher.

Now, it was the custom for patients or their friends to provide the herbs which the doctors required; so she asked what herbs he would want.

'I want some mustard-seed,' he said; and when the poor girl eagerly promised to bring some of so common a drug, he added: 'You must get it from some house where no son, or husband, or parent, or slave has died.'

'Very good,' she said; and went to ask for it, still carrying her dead child with her. The people said: 'Here is mustard-seed—take it;' but when she asked, 'In my friend's house has any son died, or a husband, or a parent, or slave?' they answered: 'Lady! what is this that you say? the living are few, but the dead are many.' Then she went to other houses; but one said, 'I have lost a son;' another, 'We have lost our parents;' another, 'I have lost my slave.' At last, not being able to find a single house where no one had died, her mind began to clear; and summoning up resolution, she left the dead body of her child in a forest, and returning to the Buddha, paid him homage.

He said to her: 'Have you the mustard-seed?'

'My lord,' she replied, 'I have not: the people tell me that the living are few, but the dead are many.'

Then he talked to her on the impermanency of all things—pointing out to the poor girl how the affliction from which she was suffering was not peculiar to her, but was common to all her fellow-creatures—till her doubts were cleared away, she accepted her lot, and became a disciple.

#### THE TREATMENT OF JUVENILE OFFENDERS.

For some time it has been generally acknowledged that some reform is needed in the matter of the treatment of juvenile offenders against the law. The course usually followed till quite recently was to inflict punishment either by imprisonment or whipping, and occasionally by both; while in certain circumstances, the young person was sent for a period of five years to a reformatory. Many difficulties undoubtedly surround the question, as in numerous cases the children who thus come under police surveillance are incited to petty acts of theft and other criminal practices by the cupidity and heartlessness of degraded parents, who do not count the moral destruction of their children too high a price to pay for the selfish gratification of their own vicious habits. But on the other hand, many children offend against the law out of mere thoughtlessness, or from the influence of a bad example, or from the associations of bad company, while neither they nor their parents can be regarded as on that account really bad people. In such cases, it is felt that the child's experience of imprisonment, especially if that imprisonment should be repeated, is apt to have a degrading effect upon the subject of it. Referring to this, Sir John Lentaigue, Inspector of Irish Reformatories, says: 'If a child becomes accustomed to prison-life, it must cease to have a deterrent effect on him. Isolated in the cold atmosphere of his cell, without sympathy, he may be taught to fear, but not to love.'

The Howard Association has taken up this question heartily, and supported by the opinion of the present Home Secretary, is not unlikely to draw increased attention to the question. Reports received from judges and prison authorities in America bear out the view taken of the subject by Sir John Lentaigue; and it is not improbable that the legislature may shortly be called upon to consider some measure for the better treatment of the poor little men and women thus early drafted into the miserable service of vice and criminality. All punishment which is not remedial as well as corrective, is barbarous; and where, as in this instance, the infliction of it tends to affect for permanent good or permanent evil the lives of so many thousands of those who will be the men and women of the next generation, it is satisfactory to know that our judicial and legislative authorities are actively bestirring themselves to remove what is defective in the present system.—Those who would desire to know more of this movement, may do so by means of the Annual Report of the Howard Association, 5 Bishopsgate Without, London, E.C.

## DOLL PHILOSOPHY.

'No, thanks, aunty,' answers a winsome little maiden in one of the drawings of the modern leader of artistic humour—'no, thanks,' refusing the offer of a new Doll. 'I should never love another Doll like this; for see, it has only got one eye, one leg, and one arm; and nobody would care for it if I didn't. Proper Dolls can take care of themselves, you know!' What devoted fidelity shines out of this smile-provoking logic—what love, tender and helpful, covering all defects of the object loved! What a glimpse of character is there—a crooked, comic reflection, but a very bright one, thrown from a womanly character somewhere in the future, self-forgetting and true, faithfully cheering some life that needs comfort, or devoted to some weak erring mortal, whom love makes dearer than perfection, and whom 'nobody would care for if she didn't.'

As an index of the mysteries shut up in little maidens, the commonest Doll is a wonderful thing. The child-owner is peculiarly sensitive about it, especially if the boys quarrel with it, or if Paterfamilias, unaware of the ubiquitous nature of Dolls, sits down upon it in his arm-chair to read his evening paper; or if Materfamilias exiles it from society down-stairs because of its propensity for shedding bran. Oh! those Dolls, what tell-tales they become; not the talking Dolls alone—which tell no more than the dumb rag-bundles—but all the legion, even those that never winked an eye, or responded to a squeeze with an intestine squeak!

There is something humanly interesting about the whole of Doll existence. Out of graves where, uncounted centuries ago, baby hands were folded to rest, with pagan rites, and the child's terra-cotta toys put in around their little owner ere the earth was thrown, under who knows what rain of tears, as real as ours—out of those graves of little ancients vanished in dust, they have dug up slim, straight, tiny human figures, made roughly of baked earth, some of them perhaps household gods of the nursery, but amongst them

surely, judging from the rest of the toys, that wonderful thing the Doll of antiquity. The mimic child in the child's possession seems to be, in some form or other, almost as old and universal an institution as children themselves; and for all we know, the professors of scientific comparison might have a great deal to say about these universal playthings. But we are afraid of the havoc made by science in the nursery. We leave the problem of Doll development to the scientists—the same ruthless discoverers who have found out that Cinderella's slipper was not glass at all, but grass—*vert*, not *verre*—and have otherwise tumbled down about our ears the prettiest ornaments of the old nursery castles-in-the-air. For our own part, we are content that Dolls were always dolls, and have developed into nothing greater. Their sphere is the nursery. They are only denizens of child-world.

Rag, wood, and india-rubber, china, composition and wax—we can imagine the immense Doll population gathering about us impatient for attention, and all leaning up against each other, for it is a peculiarity of Doll physique that, as regards standing up independently in the world, a Doll is unmatched for helplessness by anything under the sun—except a soda-water bottle. The weak point of the primitive rag-baby was the human face divine in coloured chintz, until at last it has been painted on white calico. The wooden genera of the family had an objectionable stare, and were too liable to be scalped. The china cousins suffered from fragile noses (and heads) and an unnatural shining skin. India-rubber got over the danger of breakage; but the immortals have, like old Tithonus, the gift of life with the gift of youth forgotten, and the period of Doll existence being over, their washed-out Kaffir complexion is frightful to see. Composition with a thin skin of wax is the most popular in nursery society; but the *élite* of Dolls will ever be the waxen fair ones endowed with human hair. All Dolls' hair has at least one human property—that of falling off. But fortunately human baldness is a gradual sorrow; not

like poor Dolly's, one shock of consternation. This is the most trying misfortune to a Doll-loving child. A creature with only one eye, one leg, and one arm, may still be cherished; but a scalped Doll is a monstrosity. Yet even greater defects than this can be cured; indeed medical science pales beside the wonders done in a London 'Dolls' Hospital.' 'What a beautiful Doll!' we once remarked to a communicative-looking little stranger. 'Yes,' said the communicative little one proudly; 'and this is her *second* head!'

A motherly instinct lies deep down in the Doll-keeping mania; but there is a sisterly or confidential relationship as well. The child is a little mother when, with self-imposed restraint, she keeps still for ten long minutes, pretending that the Doll is asleep; or when she teaches that most uninteresting pupil; or gives her an imaginary cold in order to comfort her with muffling shawls. But there is a friendly relationship of equality—proof of the need of a confidante, a good keeper of secrets—when Miss Polly, in enforced exile, confides to Miss Dolly that *Made-moiselle* is horribly cross, to blame her for not remembering French verbs, when *she* herself doesn't know plain English verbs yet when she's talking—and English so easy! Or in happier mood, she may take counsel about Papa's new shilling, and wouldn't it be the nicest way of spending it if she bought a money-box to keep it in?

It is curious to note the different degrees in which children of different character or surroundings are credulous about Doll-life. Doll-life is not mistaken for real life, yet it would be hard to define the distinction made in the child's mind, when a willing imagination has worked habitual self-delusion. The same well-known master of humorous black-and-white art, who drew the child devoted to the one-eyed, one-legged doll, represents elsewhere a little girl begging her mamma not to let remarks be made about the Doll when the Doll is there, because she has been trying all her life to keep that Doll from knowing she was not alive. This suggests the utmost degree of delusion, and the child's plea inverts the real state of the case; she had been trying all her life to keep *herself* from realising that the Doll was not alive. Such credulity leads to sympathy and the desire to do service—the course naturally taken by interest in dumb pets that really possess life. The old Doll is believed in, through long habit of imagination, much more than the new one; and there is likely to be most credulity in a child who has one sole companionable Doll. Yet there are motherly little maidens whose hearts expand indefinitely, adopting a family of little and big, without losing interest in any, and sympathising with all. Sometimes in such a case the faded old Doll or the maimed one gets most sympathy—a very touching trait, the promise of great tenderness in the years to come.

Large size is not necessary for the child's belief; and why should it be harder for a child to see full-sized humanity in a three-inch mannikin, than for us to see in a three-inch engraving, with no intermediate process of thought, the full immensity of mountain, forest and sky? We confess, we once believed size indispensable for sympathy,

until we discovered the capability of young hearts for loving sensitively the least thing, when a blue-eyed little maiden was hurt in her feelings because her china two-inch Doll, clad with Spartan simplicity in cotton print that might be anything from a pinafore to a toga, was mischievously ducked in a Doll-bath of paint water—with her clothes on, as the child complained bitterly. The anxiety that the Doll should not catch cold, was evidence of some association of human feeling with those diminutive toys. The same child's other toys might have been immersed a dozen times without touching the sensitiveness which she bore for the semblance of a human thing in her possession. To other children, it is true, Dolls are nothing more than toys, and the old toy is thrown away to make room for the new toy in fine dress.

As to Doll-dressing, it too may be an index of character, and become more than an exercise of good taste or neat work. A girl whose characteristic defect is lack of perseverance, full of good intentions but wanting the energy of persistence—will begin her Doll's wardrobe on a magnificent scale, but get tired, and leave an unfinished wardrobe and an ill-dressed Doll. The industrious helpful little woman will go about things more simply, but, being blessed with the spirit of duty-doing, will work patiently at one thing at a time, and will not be so sensible of the novelty of beginning as of the pleasure of finishing each, and at last finishing all. A spice of vanity will be evident in others, who like best a brilliant Doll-costume of grown-up fashion; and when the fine dress is soiled, the wearer is uncared for. Or the indolence of more luxurious vanity may have its childish counterpart, when the owner of a costly Doll buys feathered hats for its head and minute powder-boxes for its complexion, but has not the most remote idea of doing a stitch for it with her own hands. With various degrees of dressing and nursing, the affectionate personal interest fades gradually away, through scores of little people who are as callous about the feelings of Dolls as about the feelings of the animals that they throw back through the Ark roof, anyhow, with their legs round each others' necks, until we find at the opposite end of the scale the exceptional girls who never cared for a Doll. Some of these are already unchildlike, and conceal a real weakness for Dolls, because of a shyness of being seen with them; sometimes when they are on the verge of getting past the age of Dolls altogether, child-nature asserts itself, and a Doll appears on the scene—a refreshing escape from self-consciousness to simplicity. Other girls, studious-minded, prefer their books, but can get on well enough with a neighbour's Doll, though without any faith in Doll-life; possibly the *rencontre* ends in the mischievous freaks and personal remarks on Dolly, which Dolly's owner so sensitively resents.

Other girls, again, know more about spinning tops than nursing Dolls. They are the girls in whom, by some droll freak of Nature, one sees a girlish face with something of a boyish look, and in the child an odd reminder of a boy about the figure standing or running, and about the whole manner, which is apt to be bluff, vivacious, happy, but before strangers peculiarly gentle and subdued—exactly like Tom, Jack, and Harry, in their

lamb-like condition during the first drawing-room evening of the holidays. These boyish girls are not gushing in affection, but quietly staunch and warm, having the rare merit of meaning more than they say.

But we have not to deal with freaks of Nature; and return instead to ordinary Doll-loving girls. It is one of the most curious and pleasing facts connected with them and their playthings, that the natural beauty or the unnatural ugliness of Miss Dolly, is not the measure of kindness, except on the first day of choice and adoption. A poor child's rag-bundle may give as much delight, as a waxen, golden-haired baby in a nursery full of toy-luxuries. Again, the new arrival, in all the glory of muslin and spangles, with six new names, and smelling of new wax, may be dearer to the child a year after in a homemade gown, with chipped nose, and cheeks and eyebrows washed away. Or the child taking at once to her heart the Doll that comes at Christmas, sweet with a mother's love, may never criticise its features, nor ever perceive—as at least one little child refused to perceive—that the Doll bought secretly in a hurry on Christmas Eve had leather hands with but three fingers on each, defective glass eyesight, and ears in the neck. The child would have known and chosen a pretty face; but the giver and the season glorified its countenance, and it remained a hideous but beloved Doll. Even Dolls' accomplishments do not insure their finding more favour. The artist of child-life, to whom we have referred before, in 'Not to be Beaten,' makes one little girl, with a recumbent wax-baby, boast from her end of the sofa, 'My Doll can open her eyes!' Whereupon the other little girl at the opposite sofa-arm retorts, 'My Doll never shuts hers!' If physical beauty and mechanical acquirements were the passports to affection, the boy-dolls would never have been adopted for their oddity, nor the Japanese babies with eyes aslant and heads bald save for one tuft of hair; nor would the black-faced crew have thrust their woolly heads into the nurseries.

There remains one mystery yet. How is it that the little people who are not credulous about Doll-life, are still not impressed by the human semblance of the toy, when they attack Dolly with the penknife or scissors, to discover, like boy and girl Franksteins, the secrets of her vitality as regards inward squeaks or shutting eyes? How is it that even the callous schoolboy can extract the eyes of that flaxen-haired creature, without being startled by a sense of atrocity? How is it that his sister—who of course did not ever care for Adriana Matilda—can calmly accept possession of Adriana Matilda's eyes as curiosities, once Tommy has taken them out? Or how can she afterwards stuff her pincushion with Adriana Matilda's life-blood? These are awful and unanswerable queries; but this branch of the subject recalls so strongly our childish—imaginary—introduction to the secret chamber of Bluebeard, that we flee from it in horror, only hoping that the helpless damsels will find some knight of the nursery to take up their cause, and snatch them from Tommy next time while yet they are sound; yes, and send them straight to the Children's Hospital or the workhouse Infant Department, not for their own sakes of course, but for the sake of the weak and poor little ones, who would prize

the toys that the children of the rich wantonly destroy.

Our last word about the treatment of Dolls is not our own, but comes from no less an authority than George Eliot. In one of those pages full of close observation of the ways and workings of human nature, she introduces a Doll in the hands of her heroine, a Doll under sad ill-treatment, and so introduced as a tell-tale of character. Maggie Tulliver, when she was still a shock-headed child—now as in after-years, faulty, impetuous, hot-hearted, exceedingly lovable—was wont to take refuge in an attic, to give vent to her childish troubles—those troubles that are described as so intensely heavy, because to children there is but little sense of other coexistent things or of a future. In this long loft under the roof there were cobwebs, and worm-eaten shelves, and a tub behind which she could hide and imagine the vengeance of nobody knowing where she was; and there was also 'the trunk of a large wooden Doll, which once stared with the roundest of eyes and the reddest of cheeks,' but which she now used as a sort of fetic, wreaking upon it her rage, or sorrow, or vexation, driving nails into its head, knocking it upon the floor, grinding it against the brick columns of the chimneys going up through the middle of the loft, and all the while solacing herself by imagining it to be the person who was the absent cause of her trouble.

The whole proceeding—certainly in those pages either an actual or a possible fact—is meant to illustrate a character quite the reverse of cruel, but resolute and rebellious, with the originality of a strong nature. It is a passionate heart giving vent to anger, but really ruled by the need of loving and the power of loving. Can there be a doubt that in the days when the wooden Doll had still its red cheeks and round eyes, before it became the worn-out wooden trunk, there was never Doll more cherished and more hotly defended—even from Tom—than was this much-abused fetic? A Doll of Maggie Tulliver's!—with what kisses and tears it must have been guarded once—and would be still if she had not changed its identity into the detested Aunt Glegg or any one else. As it stands, the passage describing the last dealings of Maggie Tulliver with its unoffending head, is one of the most curious illustrations of the ways of children and the fate of Dolls.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER LV.—LONG LIFE AND PROSPERITY.

THERE is no music, to young ears, so sweet and full of promise as the blithe ringing of the joy-bells on a bridal morn. Not that it is the young only who grow enthusiastic over a wedding. As the merry peal clangs out so joyously from steeple and gray stone belfry, sending the black rooks and daws fluttering and cawing and circling high in air, hearts are stirred that might have been thought for ever dead to the sympathies that love and marriage evoke. The most wonderful women put on the most wonderful bonnets, and add, before cracked, greenish-looking glasses that cannot flatter, some bit of gay ribbon, some queer old trinket, to their usual rusty raiment, before they grace the

bridal ceremony by their presence. Why do they come? Why do they cry? Why do they adore the bride, and admire the bridegroom, and how comes it that they would resent their own exclusion as the bitterest of insults? They never saw bride or groom before; never, perhaps, heard of courtship or troth plight; and will care no more for the mated pair, when once the orange blossoms are faded, than for any other married couple that they elbow in the streets. But for a wedding they have the scent that the vulture of South America has for carrion; and so surely as the vestry door is unlocked, and the curate dons his surplice, they will be there.

It was a grand wedding—a wedding triply grand it should have been, since three couples were to plight their faith that day before the altar of the gray old Church of St Mary—that awakened the big, busy, thriving town of Southampton to a momentary sense that there was something else to care for in the world besides the current business of the carrying trade. Three marriages were to take place in the ancient church, successor, by lineal descent, of that low-browed ecclesiastical edifice, gorgeous with reliquaries and colour and saintly relics, wherein Waltheof the Saxon and William the Norman must have bent their necks in prayer before the shrines, before the king from beyond sea had quite decided to bring the northern English Earl to the sharp discipline of axe and block.

These three couples excited the public interest in very varying degrees. Arthur Lynn was to be married to Julia Carrington. People at large were glad of that. Mr Lynn was clearly a gallant, manly gentleman, and one that deserved his beautiful bride. And Miss Julia was a grand girl, with some generous impulses, as her conduct to Bertram, after the false accusation brought against him had made him dearer than ever to his friends, had proved—a girl marred, but not spoiled, by early flattery and precocious independence, and one who needed but a good husband to insure that she should be a good wife.

There was Margaret Weston, not pretty, comely at the best, but with a dear young honest face that it was pleasant to look upon—a winsome face, as north of Tweed they call it—the face of a good kind girl that loves, and is happy in her love. Her consort, a clerk in Mervyn's employment, and who was to be promoted to a Deputy Managership at the next vacancy, was a worthy young fellow enough, but not of the calibre that hits the popular fancy. Such as knew Miss Margaret were glad she should marry, and that her choice should be a judicious one; but few looked twice at the pink round face and hay-coloured hair of Mr Alfred Mottram.

But it was Bertram Oakley's wedding, Bertram and Rose's wedding, that really stirred the depths of the public sympathy. Something of Bertram's simple nobility of character, something of the adventures, the trials, and the toils through which the bridegroom had made his way, like some charmed knight of the faëry tales of old, whom Terror could not scare, whom Vice could not attract, always loyal, true, and brave, had got noised about, and had exalted the frank-hearted, keen-witted young man to the stature of a hero.

Perhaps the crowds who cheered him were not far wrong in their estimate. Bertram had not a little of the hero in him. Fearless before danger, modest in success, he had ever been merciful to a fallen foe. And then Rose—sweet, blushing Rose, as she clung to that strong arm of the young husband she had chosen—was the very ideal of a bride.

What a crowd in the church! what swarms of well-dressed people competing for pews, jostling in galleries, shouldering one another in the aisles! what admiration for the trim-waisted, soft-cheeked young bride's-maids, in the pretty uniforms chosen for their bewitching display! Louisa Denham was there, of course. The Denshires had begged of her to be their guest at Shirley Villa, for the time, where Rose yet dwelt. It was high summer now. The corn gleamed golden in the fields, ready almost for the sickle. The engagement between Rose and her true lover had been a long one, according to modern standards of engagements. Yet they waited, for Bertram was busy, now in England, now abroad, always on the wing, the life and soul of the fine old House that under his auspices was rising above the heads of its competitors. And Rose had been so patient. Nothing that excellent Mrs Denshire could say had prevented her from doing her duty, and a little more, by bright tiny Alice and curly-headed Hughie, to the last.

'It is not fit that you should do it, dear,' the worthy archeress used to say. 'You are a young lady of position, you know, and our visitor, and are just going to be married to a rich man of whom everybody says that he may aspire to anything.'

'But the darlings love me,' Rose had pleaded; 'and when I am married, and you all come to stay with us, dear Mrs Denshire, I hope you will let their old governess teach them still.'

So grand a wedding had rarely been witnessed within those ancient walls, and will be long remembered in Southampton. Perhaps the most noteworthy feature of the show, more so than the display ecclesiastical, more than the pretty toilets and blooming cheeks of the bride's-maids, more so than the many guests, the mob of well-dressed people, the rush, and crush, and lashing of whips, and crashing of wheels, the array of smart carriages and satin-skinned horses, was the heartfelt outburst of friendly feeling of the uninvited. There was a holiday at Mervyn's Yard in honour of the occasion. The shipwrights, the miscellaneous toilers in the Firm's employ were there—Long Tom, the big wright from Blackwall, who had fought at Bertram's side when the *Golden Gate* was recaptured from Captain Jack and his gang, at their head. As Bertram left the porch with his lovely little bride on his arm, Long Tom it was who gave the signal of such cheering as rang thunderous through the streets, and scared the black rooks and querulous daws into flying yet higher, in circles, in the air.

'God bless you, Mr Bertram, and her, the pretty lady,' said many a rough voice, Long Tom's the loudest, as the cheering ceased. And when Bertram paused to lift his hat, and bow his thanks for their good-will, and said a kind word as he passed to Long Tom, his old friend, on whom Rose the bride smiled too through tears made glorious by the bridal veil, the big, bold shipwright, like a great baby, as he told himself, drew

his rough hand across his rough eyes, and cried too. Then the carriages drove off, and there was an end of the show.

Years have passed since that joyous wedding-day, years worthily spent, and at the end of every one of which, as the startling bells proclaim the death of the Past, and the birth of the New Year, no lingering feeling of remorse as to wasted time and squandered opportunities, such as haunt some consciences, have beset that of Bertram Oakley. The great firm of which he has so long been the guiding spirit thrives exceedingly, a very centre and beacon-light of intelligent industry, wealthy, and using its wealth in making the world better, fairer, wholesomer, than the old world in which its labours first began. Mr Mervyn lives still, and is still honourably busy in the great Yard that bears his name; but Bertram it is who for some time past has pushed on the great undertakings that have shortened many a weary voyage, and brought far climes and strange shores practically near to one another.

The labourer is worthy of his hire; and the well-won gains of Bertram Oakley have been great, but not often, perhaps, has hard-earned money passed into better keeping. He is the master of a snug estate, and a fair old Hall, on the Hampshire border of the New Forest, where Rose dwells among her fair-haired children, and where her husband is glad to snatch his periods of welcome rest; but his life is too busy to allow him long to enjoy the rural pleasures of squirearchy. They want him in London, at Blackwall, in Southampton, everywhere; but it is with a schoolboy's content as the holidays arrive that he gets back, for a space, to the wife and the prattling pets that wait for his return to the flower-gardens, and the smooth lawn, and the great elms of home.

Elmley—the place, once the residence of a bankrupt baronet, when sickness was a constant winter guest at every labourer's damp fireside, and the whole estate showed in rotten fences, impassable lanes, and other such signs, the tokens of neglect—is not the only tract of English land of which Bertram is the owner. He is lord, too, of the manor of Whitethorn, in Gloucestershire, and owns that upland farm where his yeomen forefathers dwelt, and the village in which his own father was established before his luckless emigration to the land in which he and his wife lie buried. The Whitethorn people recollect how the rich man who had bought the estate, long in the market, shed tears when he made his first pilgrimage there, and entered the little old carpenter's shop in which Richard Oakley, the father he did not remember, yet in absence had never ceased to love, had once lived and worked. They have other reasons—those Whitethorn folks—for treasuring up Bertram's name, for has he not exorcised the Fiends of Ague and hopeless pauperism from their doors; were not their excellent schools, their Dispensary, their Cottage Hospital, his gifts; and have not they seen, thanks to him, a new generation of children growing up around them, fitter to cope with the world than that which preceded them!

Louisa Denham was pressed to make her home beneath her sister's roof. The temptation was great, but the stout-hearted little woman did not yield to it.

'You belong to your husband, now, love!' she said; 'but when you and yours ask the old maiden aunt now and then to Elmley, she will be glad to come.' And indeed she is a frequent visitor there, among those who love her, though she spends most of her life in kindly acts and words to those around her, and a great favourite in all the households of her loving friends.

Crawley, who, on being released, emigrated, has since been heard of, both at Cincinnati and Chicago. He has, it is understood, finally settled in the former city—Porkopolis, as classically minded Americans call it—and it is to be hoped that he may be a worthier citizen of the New World than he has been of the Old.

Nat Lee's grave, according to Bertram's promise, is among those of his respectable progenitors in Dulchester.

Nor were any of those early friends—they were but few—who had held out a helping hand to the former millworker of Blackston, forgotten in the hour of their need. Bertram manages, every year, to take a peep at the hardy old vine that grows beneath what was once his window in the Sanctuary of Westminster, and Mr Browse—who is gruffer than ever—knows well enough where to look for help on what he chooses to style a rainy day.

Bertram has been repeatedly asked, and by important constituencies, more than once, to accept the honours and responsibilities of a seat in Parliament. He has good-humouredly declined, however, to write M.P. after his name, which so many have reason to bless, on the plea that his natural place is not among the talkers, of whom, surely, in the Great Council of the Nation, there are enough and to spare, and that, while he lives, he must work, with head and hands. That he has done so, hitherto, to some purpose, is proved by the well-merited and most complete success—ungrudged by all—of the Merchant Prince.

THE END.

## TYPES OF MEN AND HOW THEY CHANGE.

WHETHER there are three or five or any larger number of what are termed 'types' of mankind, seems to be as yet a moot-point among men of science. And as to whether these types, be they few or many, sprang from one or several sources, does not enter into the present inquiry. All admit the Negro, the Mongol, and the Caucasian, to be the most prominent races. And all agree that there is liability to change or modification in some degree. Most scientists are of opinion, apart altogether from the Evolution theory, that the human race as a whole has gradually emerged from a state of savagedom. The opposite of this is maintained by theologians, who hold that, notwithstanding the advance of civilisation among various peoples, there has been a large amount of degeneration from the primitive condition of high-type humanity. But both of these theories necessarily recognise modification, although, according to the scientists, this process is so slow as to be almost imperceptible, and must occupy periods of time of almost fabulous duration.

Some facts which have recently come to light

seem to show that degeneracy, improvement, and apparent immutability, are going on simultaneously, according to the various circumstances affecting different peoples. Permanency of type, or at least extreme slowness of change, is deduced by men of science from the fact that the Negro race has remained unchanged for upwards of three thousand years. Sir Charles Lyell offers the evidence of paintings in Egyptian temples on this point. He says there are 'pictures on the walls in Egypt in which a thousand years or more before the Christian era the Negro and Caucasian physiognomies were portrayed as faithfully and in as strong contrast as if the likeness of these races had been taken yesterday.' There is no gainsaying such a fact as this. But it might be suggested that the conditions under which this seeming fixity of type holds good are not to be set against conditions of a different kind under which it is possible changes might take place. For example, there has been no change of what is termed *habitat* in regard to the Negro race during the long period referred to. And the question as to what would be the effect of transplanting a 'colony of Negroes to the temperate zone, with means of mental culture and other improving influences, cannot yet be satisfactorily answered. Neither, on the other hand, can the result of a colony of Europeans established in the tropics of Africa and subjected to the mental exhaustion of that climate.

While fixity of type appears to be the rule so far as experience shows, it is at the same time worthy of note that there are not wanting some instances which seem to point in the direction of certain influences under which changes may be produced in a comparatively short time. Most people are familiar with the change produced on soldiers during even a short residence in India, how they become quite bronzed by the sun. Of course this is but temporary, and passes off on their return to Europe. The residence of European families in the tropics for several generations is not so common an occurrence as to afford data for forming a judgment; but the change in the colour of the skin, though temporary, indicates what might possibly become permanent in the course of generations. By the way, regarding colour, it is stated on scientific authority that 'the Caucasians are of all complexions, according to the climate. Thus, a native of Northern Europe is fair; of Central, less so; of Southern, swarthy; a Moor, more so; an Arab, olive; and a Hindu, nearly black. Such of the Hindu women as have never been exposed to the sun, are often as fair as the inhabitants of the south of Europe.' At the same time it is stated regarding this race, which embraces all these varieties, that 'fair and auburn hair and blue eyes are peculiar to the Caucasian race.' It would appear from this that colour is by no means so fixed a feature of racial peculiarity as at first sight might be supposed.

An instance of a more conclusive character regarding permanent change of type is to be found in America. It is on a considerable scale, and extending over half-a-dozen generations, and where both climate and speciality of culture have come into play. It is a fact patent to the most common

observation, that the American of city-life in the United States has a type of constitution very different from his Anglo-Saxon forefathers who emigrated thither two hundred years ago. J. W. Jackson in his work on *Ethnology* alludes to this in rather a desponding tone. He says: 'It is perhaps yet almost premature to look for any strongly marked changes in the American population, not only from the limited period during which they have existed as a transatlantic race, but from the fact that the tide of emigration still continues, and is thus incessantly reintroducing a renewed supply of European elements. Nevertheless, we already see in the model Yankee, a mental and physical transformation so marked that it at once strikes the most inattentive and unscientific observer. Now, among the educated classes and the inhabitants of towns with whom ordinary travellers mingle most, this often assumes the aspect of an especial development of the nervous system at the expense of the sanguineous and the muscular; alimentation and respiration being also subordinated to cerebration; and in so far, it seems merely an approximation to the more intellectual types of Southern Europe.'

But this is only one phase of the matter; for the same continent and the same people show, under a different set of circumstances, an equally interesting variety of modification. Mr Jackson says: 'Among the rural population of the Far West, more especially when of prolonged American descent, a decided approximation to the Indian type is distinctly perceptible.' Regarding these, he anticipates still further change. He adds: 'From especial exposure to climatic influences, these are the classes most likely to be affected by impending organic changes, which, however, must ultimately reach even the artificially trained dwellers of the city, who here, as elsewhere, will have ultimately to be recruited from the country, and who, even in their palaced homes, cannot wholly escape or permanently defy the subtle yet potent forces by which they are everywhere surrounded.' Even more hopelessly, he remarks with reference to the cessation of fresh blood from the mother-country: 'Then will come the long centuries of struggle with climatic influences hostile to Old World organisations, and imperatively demanding that a radically Indian type shall be the only permanent possessors of an Indian soil. Already the model American has largely lost the expanded chest, muscular limbs, bushy beard, and deep-toned voice of his masculine and thoroughly Caucasianised ancestor; in place of whose grand equipoise and calm self-possession, he has become morbidly nervous and excitable. Thus early the fatal symptoms of approaching effete-ness are distinctly visible, and the only hope is that these may be the transitory effects of constitutional disease in the process of acclimatisation, rather than the more enduring effects of ethnic proclivity in the race. But a people whose women are old at thirty, never will equal another whose females can be blooming mothers at forty.' Speaking more generally on the same point, he observes that 'a race, by ethnic law operating through soil, climate and other telluric influences, gradually assumes the physical and mental type characteristic of and in a sense native to the region in which they have settled. This, or extinction, is indeed the unavoidable fate of all colonial populations,

widely separated by geographical and climatic intervals from their mother-country.'

To say the least, there seems to be ground for caution in the propounding of theories, regarding either the immutability of race or the extreme slowness of typical changes.

It is quite possible that a similar instance of change of type, though not yet so strongly marked, might be found in the Southern States of America with regard to the Negro population. This would naturally be in the direction of improvement. But several hindrances have occurred here. Fresh cargoes of Negroes were supplied by slave-traders direct from the tropics. The State laws prohibited the slaves from receiving the simplest elements of education, extending in most cases to free coloured people, and the very condition of slavery itself being unfavourable to the cultivation of the mental powers. Notwithstanding these drawbacks, and the fact that the difference of climate does not exceed twenty degrees, there can be little doubt that the Negro population of the United States has decidedly improved in type. The capacity shown by many for acquiring the mechanical trades, and even the higher education, indicates the possibility of further changes in the physical sphere. There has not been time to allow the effects of freedom to be developed; but this will yet afford data for the future scientist, which may be anticipated to point still further in the direction of typical modification.

The portraits depicted on the temple walls in Egypt have also been used as an argument in favour of the extreme antiquity of the human race. In allusion to this inference, Mr Jackson asks: 'What shall we say to the contrast presented by their physical characteristics? Who shall admeasure the gulf of time which separates the high-featured Iranian from the woolly-haired and thick-lipped African?' These are perfectly legitimate questions. But if the supposition be allowable that the original progenitors of the human family were of a type somewhat intermediate between the Iranian and the Negro, and that a colony migrated say a thousand years before the date of the paintings to the centre of Africa, would it not be a little unphilosophical to say that a Negro type could not be developed in that time? If two hundred years is sufficient to transform the Anglo-Saxon into the modern American in a latitude little more than five degrees southwards, why should not a thousand years in the tropics change a Mesopotamian into a Negro, with an interval of thirty-five degrees? The tropics are not conducive to action either bodily or mental, especially the latter; and the brain and nervous system would soon become deteriorated through inaction, while the osseous portion of the frame would develop in undue proportion, just as a tree grows to wood rather than fruit when placed in unfavourable circumstances.

It is rather singular that the author last quoted suggests an appropriate answer to his own questions, on another page: 'If this superior destiny awaits the Negro in the future, why was he so hopelessly immutable in the past? We reply, his history was a case of arrested development arising from unaltered circumstances. He is still the woolly-headed, animal-faced African represented on the tombs of the Pharaohs, because his environment is identical with that of his ancestors.

Change the influences, and in process of time you change their subject-matter. Give this indolent savage new wants, and you stimulate him to fresh exertion for their supply. Give him more enlarged ideas, and they will ultimately eventuate in a grander course of action.'

Allusion might also be made to the generally acknowledged fact, that 'the cradle of mankind' is the East, or at least that Europe was peopled in some instances from Asia. It is on record, for example, that the peoples of Northern Europe—the Scandinavians, &c.—were of Asiatic origin, from the neighbourhood of the Black Sea and the Caspian, and that within a period not earlier than a thousand years before the Christian era. It is hardly necessary to say that the Scandinavians differ very materially from the inhabitants of the region whence they originally came.

These remarks may appear to some to point to conclusions of too speculative a character. But it should be borne in mind that science itself is largely tinged with speculation. The truth on the subject of race and its antiquity is too important to be rested on the meagre collection of facts at present in the possession of scientists. Theories may be propounded, but they must accord with the facts. If the leaders of science claim the right to theorise, and exercise it, why should the lay portion of the public be prevented from following their example? If there be apparent permanency of type in a settled *habitat*, why should modification not be expected under a change?

## MY LAST DETECTIVE CASE.

### CHAPTER II.

I NEED scarcely say that the 'regular' bad characters of the district had been duly looked after by our people; but there was nothing to connect any of them with the murder; which, take it altogether, was more deficient in clew than any crime I had ever had to deal with. So I was regularly at sea, as one may say; was expected to do something in the matter, to show that I was really at work, but with no more idea what it was I ought to do, or in which direction I ought to turn, than if I had been a baby in arms—a pretty position for a man who had been repeatedly described as an active and intelligent officer.

I shall never forget the aimless, drowsy sort of way in which I first started on my quest; I really felt half inclined to arrest some promising 'rough' on pure spec. Calling up all the mysterious cases I could remember, I thought of one where the eye of the murdered man—a bank manager in Ireland—was examined by a microscope to see if, in accordance with the popular belief, the last thing upon which his living glance fell was permanently fixed on the retina. Had this been possible in the case of old Daryett, I think I should have tried it; but he had been buried a week ago. I recollected, also, that in the case I have quoted, it was proposed to consult a spiritualist; and the idea immediately came into my mind that I would go and see old Mrs Hatherley—Mother Poll, we used to call her—to get her to look in the cards. I laughed at myself for thinking of such a thing; not but what the old girl was very clever; but as I did so, the

idea struck me with wonderful force, that there might, after all, be something in a spiritualist. A spiritualist! one who can read people's thoughts, can see through brick walls, and can make tables walk about—why, there *must* be something in such a person; so why not try one? Suppose I tried two or three; if they failed, I could not be any worse off than I was before I applied to them; while if half I had heard about them was true, I might get some sort of a clew; even a guess would be better than nothing.

The papers had mentioned—which was a pity—putting the announcement into one of those little bits which come after the leading articles, and which no one ever heard of when I was a boy—that 'the Upper Broughton Street mystery had been placed in the experienced hands of the well-known detective, Sergeant Nickham; and it was reported that this shrewd and intelligent officer had already obtained evidence of the most important character.' Now, the reader is perfectly aware that I had not done anything of the kind; but it was clear that if I did not do something, I should get as much undeserved blame, as I was now getting undeserved praise; so I determined to consult a spiritualist.

It may easily be supposed that I was asked a great deal about my plans. The coolness with which persons who have nothing to do with the matter will ask an officer to give them an account of his plans in the most difficult cases, is astonishing. They seldom get much by doing so. Mr Hellip, my lodger, took great interest in my movements, which was perhaps not so very wonderful; yet we had been so distant, that I did not like it so much as he evidently supposed I did, in spite of all his compliments. He was always prophesying my success, and seemed to have a most wonderful estimate of my powers. He made me promise to stand a bottle of wine, the day I received the reward; and after I had done this, he was still more constant in his inquiries. After all, I did not much mind it, knowing, as I have said, what a horrible interest some people take in such affairs; but I found he had taken to cross-question my wife, to see what he could get out of her; which was not fair, and I did not like it. Yet I must advise the reader that while I, having been in the police force more than twenty years, was a great deal too experienced to fall into any trap, nevertheless I am proud to say of Mrs Nickham, as I can say with perfect justice, that he was a great deal likelier to get the truth out of me than from her. For all that, he managed to guess that I had some move in hand; so he told me he should soon have that bottle of wine at my expense, nodding and winking every time he said so, as if he knew all about it.

I found there was a spiritualist who lived in a street turning out of the Marylebone Road; and so, directly I had made up my mind, I set off at once to see him. He was out, the first time I called; so I made an appointment for the next day; and then I found he had been called into the provinces, and was not expected home for a week or a fortnight; therefore, he would not do. I looked up another, and went to him; he was at home, but busy. However, I made an appointment to see him on the next night but one. I was to pay a guinea—a perfect throwing away of the money,

I was convinced, but I had made up my mind to risk it.

There was a young man at this second house, employed as footman or porter, for he was not in livery, and he was very civil to me. I always make it a rule to be civil in return; consequently, I mentioned that I was going to the public-house at the corner, and if he could spare time, I should be glad of his company for five minutes. Now, in point of fact, I had not intended to go to this or any other public-house, as I really wanted to get home to my tea; but seeing him so civil, I made myself agreeable on principle; if I did not want any help from him then, I might on some other occasion, and you never can tell, you know. As it appeared he could spare the time, he went over with me, and said he would take a glass of stout and bitter; but I ordered a whisky and seltzer for him. He was quite struck by such liberality; I could see that. 'My boy!' I thought to myself, 'if I should have to ask you any questions about spiritualistic or mesmerising dodges, you will answer if you can; I will bet a new hat you'll do it.'

We parted very good friends; but careful as he was, I felt as sure and positive he knew I was in the police, as though he had told me so. Very likely he knew my name. I had not thought of this at first; and if I was to try and tell the reader how I came to know it, I daresay I should fail to make myself clear. You can't always put these things on paper; but that my new acquaintance spotted me for a policeman, was a fact, and I could not quite make up my mind, as I rode home, whether it was a lucky or unlucky thing for me that he did so. On the whole, I decided that it was a good job.

The reader will have guessed that I said nothing of what I was about to any one except my wife. I always told her; and many a good hint have I gained by doing so. As to the old proverb about women never keeping secrets, it is the grossest libel I ever came across. If it was worth while, I could tell you now of fifty cases where women did keep secrets in the teeth of temptations which would have made men in their places sell up their own grandfathers and grandmothers. Mrs Nickham highly approved of the mesmerist scheme from the first; and I was glad she did so, although I had certainly expected as much, for I never knew a woman who did not believe in some kind of fortune-telling; and very few men, for that part of it. For the last day or two, I had not seen much of my lodger, as he was laid up with rheumatism, only getting out for an hour or two, when he treated himself to a ride in a cab, by way of exercise, which he could afford to do, as he was very well off. Anyhow, there was no cross-questioning now from him, and I was glad of it.

Well, on the evening arranged, I, of course, went to the spiritualist's, and also, of course, was let in by my friend Charley. I ought to have mentioned his name before. I nodded. He smiled, and said: 'So you are punctual, sir;' and showed me into the parlour. There I found Mr Sievwright, the Professor; but I was surprised to find he did not do the prophesying and vision business himself; he had a young lady-assistant who went into a sort of trance. I suppose I need not explain all the process. Since that time, it has

become so common, that almost every reader must know all about it; what is more to my story is the fact that I could not make anything out of the broken, wandering kind of speech which this young person uttered. I thought then, and think now, that she was really insensible; and it was plain her mind was running on a murder from the first; which was curious, for the interview was half over before I let them know what sort of transaction I was asking about. But what she said was of no more use to me than if she had been talking about a game at cribbage, or of making a plumpudding. It was a dead failure. But I had not expected much from it.

Mr Sievwright was very civil and candid in his style. He said he was afraid the revelation was not distinct enough, but another night it might be better. He would not make any charge, if I liked to come again. I was, of course, equally civil, and said how very clever I thought the young lady was, and how much obliged I felt for the trouble they had both taken, and that I would let them know if I thought of hearing any more. I made up my mind on the spot that I would not come again; but, as I have said, you never can tell when you may want people, and it is not a great deal of trouble to say a few civil words. I bade them 'good-night,' and was let out by Charley, to whom I bade 'good-night' also. I was passing out at the street door as I spoke to him, when, to my astonishment, he slipped out too, and holding the door in his hand, to prevent its slamming, whispered: 'You will excuse me, sir; but I have often seen your face before, although I don't know your name. Ain't you in the police?'

'I am,' I said at once; for there was no use in beating about, as I could see he was in earnest.

'And you are here on business?' he went on.

I nodded, for he was speaking quick and low.

'Wait for me, sir, across the way, at the corner,' he continued, in the same hurried manner. 'I should like to have a word with you, if you don't mind waiting five minutes.'

I promised to wait, and he slipped in again; while I, wondering what was coming now, went over to the corner, where stood the public-house to which I had taken him, and smoked a cigar till he came.

I was always of a reflecting meditative turn; and as I grew older, I became fonder of a quiet interval of thought, which, I believe, is a rule with people who are getting on in life; but I don't know that I ever applied myself to think out anything more thoroughly than I did to guess what on earth this young man could have to say to me; and I was never wider of the mark in any speculation in which I may have indulged. I dismissed at once all expectation that he knew anything about the Upper Broughton Street business, although that had first of all rushed into my mind. I decided that he was going to turn evidence against his employer, and to tell me that I had been done out of my sovereign. I made sure I should not like him any the better for doing this; I might use his information—very likely I should do so; but I like to see people stick to the shop.

He was rather longer absent than the time he had mentioned; but if I had had to wait till twelve o'clock, I should have done it, for it is a rule of mine never to throw a chance away. At last he came: 'Sorry to keep you waiting so long, sir,' he began; 'but I could not get away sooner.'

'All right, my boy,' I said. 'My time is my own, so there is no harm done. But since you are here, suppose we try another seltzer and whisky?'

'Thank ye, sir,' said the young fellow; 'presently I shall feel much obliged for it; but if it is all the same to you, I should like to have a few words with you out here, on the quiet. It would not do for me to be overheard.'

'Aha! it is the spiritualistic business, then,' I thought; but told him I was at his service; so we turned into a quiet crescent which was close by, and he crossed over to the side where the iron railings inclosed a lonely deserted plot of grass, away from the houses; and here, as we walked in the shade of some trees, he began.

'No one is likely to overhear us now,' he said; and I mentally agreed with him; in fact, I thought he was taking a most unreasonable amount of trouble over such a trifling matter. 'You told me, sir, that you were in the police?'

I nodded.

'I have heard a few words passing between Mr Sievwright and Miss Jukes, our clairvoyant, as to your business,' he went on; 'and being in the next room this evening, I heard her while she was in her trance.'

'Well, if you did, you could not make much out of it, unless you are a good deal sharper than I am,' I thought; but I did not say this aloud. I merely said 'Indeed!' and he went on again.

'You are here about a murder, are you not—a murder to which you want a clew?'

'Hullo!' thought I; 'this is what I did not reckon on. What is coming now?' Then I said aloud: 'Suppose I am or am not, what then?'

'But you are,' returned the young fellow; 'and I am not the only one who knows it. You were watched coming here.'

'What! to-night!' I exclaimed, quite staggered at this.

'Not that I know of,' he replied; 'but I should say it was more than likely, as you were certainly watched to this place the other day, and I saw the man who was spying; but I did not know what he was after, then.'

'How do you know it now?' I naturally asked.

'Because, when I let you in on the first day that you called, I saw a man go past on the other side of the way. Soon afterwards, I had to let another visitor out, and I saw the man again. I noticed him this time. There was something about him like a man on the lurk, so I looked for him when I let you out.'

'But you were with me then,' I interrupted.

'Quite right, sir,' said Charley; 'but still I looked for him, and I saw him a little way off; so I says to myself: "This don't look like a matter of chance; but if it is, you won't be here when we come out of the Crown. If you are slinking about then, I shall know you are on the watch." He was there when we came out; and so, as I am sure it can't be me he's a-watching, it must be you.'

But I saw him again yesterday, in a different part of town.'

'Then I should think it's you he's watching, after all,' I struck in with a laugh, not because I fancied it such a laughable matter, but to see how he took it.

'No, sir,' says he, seriously enough, and shaking his head; 'there's no one thinks me worth watching; but with you it may be different. However, to come to the point, sir. I am here only three days a week, on the reception-days. I fill up my time at another establishment of the same kind, only not so stylish a place, in Clerkenwell. There I am of a little more importance than I am here; in fact, I am the assistant, and help in the experiments, instead of being only a porter. Well, sir, last night that very man—the man I had seen watching you—called there.'

'Called there!' I exclaimed. It is a very bad plan to interrupt a story, but I was fairly surprised into it.

'Yes, he did indeed,' continued Charley; 'and as I was with the proprietor at the time—dressed up, of course—I heard all he said. I did not like his look when close, to him, any more than I had done at first; and he hummed and hawed so much, and fenced about so long before coming to his business, that I was sure he was after no good. We, of course, thought he wanted to consult the clairvoyant—that's me there, you know; and I am a very good one. But after a deal of preface, he said he only wanted to ask a few questions about the way other persons consulted the spiritualist, and what the clairvoyant's powers were. He asked how the clairvoyant answered, and whether he could refer to events which had happened several weeks before; so that if he or any friend of his wanted to inquire about the commission of a crime, was it possible for us to throw any light upon it. I can tell you, sir, that he himself threw as much light upon it as any clairvoyant could; for I saw at once that he must himself have committed some crime, and was afraid you was consulting us in hopes to trace him. Of course, I could not have made such a guess as this, if I had not seen him slinking about after you, or if I had not known you was in the police; no, nor if I hadn't got a pretty good guess as to what you was a-coming to our place here for. You may be sure we did not quite satisfy him; and the end of it was that he has made an appointment for to-morrow night—I was engaged here to-night, as you know—to see the clairvoyant. Now, sir, you may depend upon it that if it is worth his while to spy on you, it's worth your while to look after him; and if it's worth his while to ask about your business with the spiritualists, it's worth your while to find out why he is so anxious.'

'Upon my word!' I exclaimed, when the young fellow had finished, 'you ought to be in the police. I am not joking, Charley, but am in sober earnest. There is not one fellow out of fifty who could have fitted the pieces of the puzzle together as you have done. Right or wrong as it may prove to be, it is so much like the real thing, that it does you credit. I will tell you who I am, and all about my business. My name is Nickham. You have heard of Sergeant Nickham, I dare say.'

'Heard of you! heard of you!' he repeated,

with genuine admiration in his voice, and there really is something delightful in being a popular character. 'I should think I had! Why, then, you must be on the Upper Broughton Street business!'

'I am,' I said; 'and an intelligent young fellow like you might easily be of great use to me. I may as well have you with me thoroughly, and then, if I draw the reward, you shall not be forgotten. This man will come as agreed, I suppose. But should you know him again, if he did not?'

'To a certainty,' returned Charley. 'I know his name, as it is.'

'You know his name!' I exclaimed again. 'I had not expected to hear you say that. What is it?'

'Brake—Mr Herbert Brake,' said Charley.

This was coming to the point, and no mistake; but it was too good to be true.

'Did he give that name of his own accord?' I asked.

'O yes! quite readily,' replied the young fellow.

'And was he a quick-moving, bright-eyed, keen-looking little fellow?' I asked again; 'very dark, with a carefully trimmed moustache?'

'O no; not at all,' he answered.

I expected to hear as much.

'This was a thick-set man, of middle age. He had a big fleshy face, with small eyes, that never looked at you for two seconds together—at least, I never could fix them. He had a way of constantly grinning when he spoke; but he did not look a good-tempered man, for all that.'

Here was exactly Bill Jenkins's account of the stranger over again, and I had a curious feeling of being greatly surprised, and yet, at the same time, of having expected it. Once again, too, I seemed to have been dreaming of such a man. As the description could not in the least apply to the only Mr Herbert Brake who was likely to be concerned in the business, I at once took a greater interest in Charley's account, and in the whole transaction, I may say, than I had previously done; for we looked like getting hold of something tangible at last.

Here, clearly, was a party watching me. I had not believed that at first; but I was certain of it now. This was evidently a party who knew a good deal about the matter; for while he was cunning enough not to drop the least hint as to what crime he was interested in, he was also cunning enough to let fall the name of the man already suspected of the Upper Broughton Street murder; a name which would be sure—he must have argued—to cast additional suspicion on the young fellow, if this visit to the spiritualist's ever got talked about.

It was not a bad idea; but in criminal matters, above everything else, to my thinking, all depends upon how any move is taken. Owing to my having come across my new friend Charley so early, I was able already to decide for certain that young Brake could not be the criminal I was trying to discover; while, as this stranger was anxious to have the young man's name mixed up with the business, he or his friends had a good reason—perhaps the best of reasons—for wishing him to be suspected.

I told Charley I should like to have a night to think the matter over, cautioned him not to say a

word to any one else; and then made an appointment to meet him at the *Two Gridirons*—a house I knew in his own neighbourhood—at one the next day, when I would let him know what I had decided upon. Of course, we had the whisky and seltzer at parting.

## SOME QUEER DISHES.

BY DR ARTHUR STRADLING.

IN TWO PARTS.—PART I.

*De gustibus non est disputandum* is a dictum as trite as the observation that 'one man's meat is another man's poison;' and a glance at the widely different gastronomic tendencies of the human race in various quarters of the globe forcibly brings to our recollection the command that we call no created thing common or unclean. It is related of a distinguished traveller that he once entertained a great African Prince who had been induced to cross the water and behold the wonders of the white man's land. He had already spent some time in England, and was no doubt acquainted with all the masterpieces of the culinary art that British hospitality could afford; therefore, when we hear that his host called his especial attention to some conserve of apricots, we may infer that the sweetmeat was something very choice indeed. 'Yes,' admitted the dusky monarch, after partaking thereof, 'it is good, it is delicious, but—did you ever eat white ants?' The dainty of his native land, still dear to memory, triumphed just then in his imagination over all the impressions of civilisation.

What marvellous variety of tastes, of likes and dislikes with regard to special forms of food, from cannibalism to currant-cake, we find among people physically constituted alike in every respect. This person eats his meat burned to a cinder; that will touch only what is rawly underdone. George III. preferred fish when it was semi-putrid; his successor's weakness was hot plum-bread crumbled up in a quart of cream. Lord Bacon is said to have lived whole weeks at intervals on nothing but oranges; while the elder Pitt could not endure the sight of fruit, and never suffered any to be brought into the room where he was.

It is not, however, to these individual and for the most part personally capricious predilections and distastes that I would ask the reader's attention, but to those substances in common use as articles of diet in certain parts of the world which we from prejudice—or rather, in habit—look on with little less than abhorrence. This sentiment, by the way, we often find reciprocated among foreign nations who in their turn express astonishment and disgust at some of our preferences. For instance, Miss Bird in her book *Unbeaten Tracks in Japan*, tells us that the Ainos, the strange little-known aborigines of that weird land, now found only in the island of Yezo, live chiefly on 'a stew of abominable things'—seaweed, slugs, fish, roots, berries, bear, mushrooms, and a

soup made of putty-like clay, boiled with a wild lily-bulb; yet these people thought it 'most disgusting' that the authoress should drink milk and pollute her tea with a fluid having so strong a smell and taste! Each according to his own taste, must have been her mental remark. In Brazil, the goose is considered coarse and unfit for food, and the natives of Malacca will not eat fish of any kind. Antipathies grounded in religious scruples, such as the proverbial detestation of pork which Jews are supposed to entertain, and the fastidiousness of certain castes of Hindus, hardly come under this category; but it may be observed that the Jewish dietetic system, as laid down in the book of Leviticus, has been demonstrated by physiologists to be the most perfect sanitary code that could be devised.

Amongst mammals and birds, it is difficult to say what species are *not* eaten in the countries where they abound. Probably the big cats and dogs would be exceptions, though one hears now and then of mighty hunters broiling a steak from the lion which has just fallen a victim, to their powder and shot; but in China and other parts of the East the smaller domestic varieties are recognised luxuries of the table, and are exposed for sale as such in the markets. In a country so overpopulated as China, every morsel of any substance that is edible is eagerly sought out and devoured, so that not only cats and dogs, but rats, mice, slugs, and almost every living thing in earth, air or water go to feed the half-starved masses. Rats are split open, dried, pressed and powdered with a finely ground white bark, which gives them the appearance of haddocks as they hang in long strings over the vendor's stall.

The birds' nests, convertible into soup, so often quoted, must not be confounded with the industrial products of our own starlings and thrushes, which might be boiled a long time without yielding much nourishment, unless the bird happened to be inside; edible nests really consist of a kind of isinglass, and are constructed by a small sea-bird out of the gelatinous bones of dead and decaying fish. Most of them are brought from some caverns on the sea-shore north of Shanghai; but they are not very plentiful, and there is no great demand for them. The soup is thick, slimy, and glutinous, and is neither so nasty as might be expected nor as nice as could be desired. I have been vividly reminded of it in Brittany by a decoction of 'escargots edibles'—land-snails. By-the-way, the dogs most in favour with the Chinese as 'butcher-meat' are those curious hairless ones, of which a good idea may be formed by looking at the magnificent pair of Rampoor hounds presented by the Prince of Wales to the Zoological Gardens in Regent's Park on his return from India. How this hairless breed originated is a mystery, but they are found in many tropical countries, and are there usually highly prized by their owners; though extremely delicate and susceptible of cold, they appear to be free from disease—at any rate, the skin is healthy and the baldness not in any way dependent on existing morbid conditions. The tradition is that these naked creatures are the descendants of the sacred dogs worshipped by the ancient Egyptians; and that the peculiarity originated from their being kept perpetually in the temples and bred in and in for centuries.

On the Isthmus of Panama, the tapir and sloth are eaten by the Indians, who also consider the agouti and other small rodents great delicacies. In Paraguay, the cupybara, a great amphibious guinea-pig as big as an ordinary porker, is a standard dish; and throughout the whole of South America roast armadillo is highly esteemed, and may be seen in all the cafés and restaurants of the cities, turned on their scaly backs feet uppermost, and the interior filled with a rich sauce composed of lemon and spices—much too greasy, for my palate, though the flavour of the animal itself is delicious. I have tasted monkey and parrot in Mexico, and found both very dry and insipid, but I am given to understand that the bird is not to be despised if properly dressed. That most malodorous marsupial the opossum is recognised as an article of food in Rio Grande do Sul and other provinces which it inhabits, where, however, they bury it in the earth until the flesh is free from its characteristic offensive smell before cooking it. Its cousin, the dasyure, is treated in the same way in Australia, where it shares the honours of the table with kangaroo.

It seems an extraordinary thing to speak of eating a skunk, and that, too, in a part of the world where beef and mutton are infinitely more plentiful than bread; yet it is a fact that the Gnachos of the Banda Oriental are in the habit of hunting this creature for the sake of its flesh—nor is this incomprehensible to any one who is acquainted with the true nature of the skunk. The disgusting liquid which it ejects is contained in a gland on the back, and constitutes its weapon of defence. Certainly, the effluvia is the most horrible and enduring that may be conceived, and man and beast will fly from it; but if it be surprised and killed before it has time to use this, and the gland be afterwards extirpated with care, the rest of the body is destitute of all offence. Skunk-skins are largely used by furriers, and beautiful skins they are, and the animal is capable of being domesticated, as it never emits the secretion except when in danger or alarmed. I never ate a skunk, but I have handled a tame one without any olfactory disturbance.

In the West Indies, where meat becomes tainted very rapidly by the agencies of the damp motionless heat, and abundance of insect life, it becomes necessary to cook it almost as soon as it is killed. To obviate the toughness which would result from this, it is wrapped in a large fleshy leaf which has the curious property of softening the muscular fibre and rendering it tender. If left on too long, the juice permeates the meat and disintegrates it altogether, hastening its decay. I do not know the proper name of this leaf—the black people call it *Sangulo*—nor the nature of its action; there is a large tree in the market-place near the King's Wharf at St Thomas. Down in the River Plate, when an *estanciero* wishes to entertain you hospitably, he gives you cow-beef, that being considered the primeest. I spoke just now of meat being more abundant than bread in that land, and this will readily be believed to be the case where a sheep may be bought for half-a-crown, or an ox killed for the sake of a particular 'cut,' and the remainder left to the dogs and foxes. One of the best steaks I ever ate was dug out of a newly-slain bull, with about two square feet of the adjacent hide still adherent to it; in this it was wrapped

and so broiled on the embers of a wood-fire. Whole droves of mares are here boiled down for tallow; but the tongues are preserved for food. Horse-flesh is tough and stringy, and will never rival beef in popular estimation. English mutton bears a great and just reputation for excellence all over the world. This is particularly the case in the West Indies, where a loin or leg constitutes a much grander present than a haunch of venison at home; and the gift of half-a-dozen chops is said to have swayed the destinies of an island.

If he were a bold man who first swallowed an oyster, that was a bolder who first investigated the alimentary properties of a crab. Surely he must have been in the last extremity of hunger when he broke open the hideous spidery crustacean and 'went for' its uncanny internal arrangements. Land crabs, the most destructive pest of tropical countries, are far more delicate in flavour than their seafaring brethren, but are much smaller, and are prepared for the table in a different way. When Desfarge, the great French swindler, escaped by night from the convict prison in Cayenne, he sank up to his waist in a quagmire, and being unable to extricate himself, was eaten alive by these crabs. When sailors catch a shark, they make barometers of the skin, walking-sticks of the backbone, a chimney ornament of the jaw, and eat certain portions of the flesh—partly, no doubt, because it forms a relief to the monotony of salt junk and pea-soup, but chiefly perhaps in the full savage gratification of triumph over their hereditary foe. The fishermen around our own coasts find the back of the dog-fish—which, it may be, has robbed them of their hoped-for catch—a welcome addition to their frugal meals; and if porpoise were a trifle less oily, all three, to my thinking, would be at least as good as sturgeon, of which royal but tasteless fish I once had the privilege to partake. Caviare, though familiar, must certainly be classed also among queer dishes.

Perhaps the most toothsome denizen of the sea (or air) is the flying-fish. Barbadoes is the place to get them—even the bumbout women bring off ready-cooked flying-fish alongside newly arrived ships among their stock-in-trade of bananas, shells, guava-paste and pepper-punch. The Barbadian fishermen catch them at night by means of a net spread after the fashion of a sail in their boats; and it is no uncommon occurrence for one or more to fly in through the open ports of a vessel at sea, when she is low in the water or rolling gently.

Every one knows the big conch shells, some as large as a man's hat, which are brought home from abroad, and stuck about in all sorts of inappropriate places, from grates to greenhouses; and every one has heard that in many lands they are blown like a horn to summon cattle, or used as war-trumpets; but everybody does not know what delicious soup the original inmates of those shells serve to make. Sea as well as land slugs are used for this purpose too.

Concerning the consumption of walrus-meat by arctic voyagers, the only thing to be said is, 'Why shouldn't they?' and though it is a little sickening—especially in hot weather—to think of the merry Greenlander drinking whale-oil convivially, we must remember that in obeying the dictates of his appetite in this respect, he is carrying out a great

physiological principle, and that he imbibes not only nutriment, but fuel and clothing from his oil-flask. I once ate a sole dressed with cod-liver oil, and found it quite palatable, though demanding the addition of more salt than usual; had I not known the nature of the dish before me, I might have mistaken the flavour for that of anchovy sauce. The idea of whale-oil is certainly more tolerable than whale-milk. When the sailors employed in the whale-fisheries happen to kill a mother who is suckling her baby-whale, they collect the milk, sometimes as much as ten gallons in quantity, which they drink. Kurds and Tartars make butter, cheese, and a fermented liquor called *koumiss* of mares' milk.

Wonderful epicures those old Romans must have been, with their confections of larks' tongues, peacocks' brains, and all that sort of thing! Did they invent *pâté de foie gras*? Somehow, I am always reminded of them whenever I see a Strasbourg pie, there seems so close an analogy between the brains-and-tongue banquets and the absurdity and cruelty of making an unfortunate goose ill for the sake of eating his diseased liver. What a sensation it would cause among gourmands should some future sanitary inspector arise and seize and condemn those unhealthy geese as 'unfit for human food!' The great point in a Roman banquet seems to have been surprises. A raised crust was broken open, and singing-birds flew out; or a cover was lifted, and the table was immediately alive with active little crabs, stained bright red with acil. Talking of brains, did you ever taste a prawn's? If not, don't forget to suck the head the next time you eat one, and you will allow that this paper has not been written in vain.

As a contrast to these Sybaritic luxuries, let us turn for a moment to those tribes of Indians who eat earth. Much has been written about this practice, and various speculations and suggestions offered about 'fatty clays' and 'earths rich in organic matter;' but recent research and experiment have shown that the mere presence of solid material in the stomach is sufficient to allay the sensation of hunger for a time, so that in all probability these savages swallow the earth only to appease the cravings of nature until food can be obtained. The hunters and trappers of the Far West make pills of calcined oyster-shell and white of egg, which they swallow occasionally to stave off hunger and its disagreeable concomitants when on a long journey and their rations are exhausted. Tea or coffee would answer the purpose better, as, though affording no nourishment in themselves, they prevent the waste of tissue.

Several years ago I entered an hotel in the city of Rio de Janeiro which displayed the legend 'English Lunch' on its door-post. Not that I particularly expected to find an English lunch there, or, indeed, cared to do so, for in a foreign country I like to eat the food, drink the wine, and as far as possible speak the language and assimilate to the customs of that country. An Englishman, as a rule, never fares well abroad, simply because he always travels with his shell on his back, insisting on beefsteaks and beer, sneering at everything which is not done or seen in Pall Mall or the City, and rarely learning a word of any new tongue beyond what the absolute

requirements of life necessitate. When, therefore, I noted the item 'Aristu,' as I ran my eye down the bill of fare, I demanded the dish at once, as it was unknown to me and, I doubted not, some novelty characteristic of the locality. But I had forgotten that this was English Lunch, and I presently discovered to my enlightenment that Aristu was Anglo-Brazilian for Irish Stew—a remote corruption of words, certainly, but more like the original than was the villainous concoction of yams, garlic, grease, and *virne secca*. This *carne secca*—dried or jerked beef—is exported to the amount of thousands of tons yearly from Monte Video, Rozario, and other parts of Uruguay and the Argentine Republic. In some of the *saladeros* or factories, over a thousand head of cattle are killed daily in the season, one man being usually the executioner of the lot, and killing them by puncturing the spinal cord at the back of the head. The animals are cut up and the flesh piled in great heaps with layers of salt by semi-naked savages, half Basque, half Indian, who have a peculiar knack of causing the flesh to detach itself in flakes from the bone by giving it a slap with their broad cutlass-like knives. Wonderful quickness and dexterity are exhibited in every department of the process, but the whole forms one of the most disgusting spectacles imaginable. Mixed with black beans and *fariña*, or cassava meal, jerked beef becomes the staple food of the lower orders throughout the coasts of South and Central America.

#### THE DEAD-WATCH.

In the outskirts of the old city of Hofengratz, there stood, and probably stands now in all its solidity, a sombre, heavy-looking building, which never failed to attract the stranger's attention and arouse his inquiring curiosity. It is perhaps the most eccentric institution which a wealthy caprice could devise. An opulent and charitable community has ever been associated with the city; but it is doubtful if wealth could be diverted to a stranger channel. The good people of Hofengratz, at least the well-to-do portion, with a view to avert the horrors of being buried alive, erected, many years ago, this unique building, adjoining the city's cemetery. In it, for a certain time, and on payment of the regulated fees, their dead are watched, after being duly certified as defunct, in order that if any signs of returning life are presented, the sufferers may be restored, instead of being consigned to the earth, alive. It is altogether a most singular establishment. The building is divided into numerous apartments—which in times of epidemic command large premiums—furnished in good style, being replete with every appliance which can appeal alike to the bodily and mental comfort of the living. Here, with grim irony, their corpses are placed for the watch. In each apartment, and near to the body occupying it, is placed a curious and delicate mechanical arrangement, on which rests the motionless hand of the dead, whose slightest pressure or pulsation would be instantaneously communicated to an alarm-bell

fixed in the apartment of the attendant on duty. The alarm sounded, the house-doctor would be immediately summoned to the couch of the reviving patient, and there assist struggling nature with his art. But till the events evolved in this narrative occurred, the authorities possessed no authentic record of such a startling summons to life, and the entire efficacy of their elaborate administration remained untested.

As old Heinrich Upmann, *Geldwechsler* (that is, money-broker), shambled along homewards from the Bourse one afternoon, it was remarked by several of his neighbours that he was unusually merry and jovial, for he smiled here and nodded there with an affability quite uncommon to him.

'Look,' said Koller the tailor to his neighbour, Herr Schafstein the notary—'Look at Old Heinrich! What has come to him, the old curmudgeon? He is all smiles to-day, instead of scowls, as usual.'

'Yes; he is rather strange,' said the notary quietly; 'though I have noticed that when he is smiling, other people's tears are not far distant!'

'What do you mean?' said Koller. 'Is there work for you in view, Mr Notary?'

'I would not inquire too closely into other people's affairs,' sharply replied the notary, 'as it may draw attention to your own. Good-day!'

'Well,' said Koller uneasily, as he watched the departing official, 'that may be good advice or not, as the case may be. I wonder if he knows about my bill of acceptance, which is due next week? I could have given him his answer, though, had I been sure he didn't know. I'll go round to the *Leather Tankard*, and hear the latest news.'

The neighbours were right. Old Heinrich—as he was familiarly called—was very merry, for he had heard good news on 'Change. From the tidings, he knew that discounts would rise, and many to whom he smiled to-day would be coming to him for assistance to-morrow; and better news for him than that, there could not be; so that when he reached home, he went, chuckling, straight to his little back-room, which served for his business apartment, and carefully locked the door, to prepare himself for his expected visitors. How he would vow to his anxious applicant that money was so dear, he could not lend; no, not he; that is, unless the customer would pay double the market-rate. His terms were invariably accepted. People said money was always dear when they wanted Old Heinrich. Yes, it was very dear to him, for he parted with it reluctantly, even on his own terms. In the opinion of the inhabitants, nothing could be added to the rapacious reputation of the old *Geldwechsler*.

So with many a cautious glance round his miserable room, he unlocked his money-chest, to feast on its contents once again before parting with them. They parted company sooner than he anticipated. Koller afterwards said that, shortly before midnight of that day, he saw a man hurriedly leave Upmann's house, as he was passing it on his

way home from the *Leather Tankard*. He called 'Good-night' to him; but the man made no reply. He thought it was Herr Schafstein the notary, and took no further heed of the circumstance, as Schafstein was known to act occasionally as Upmann's agent. Koller's accuracy was doubted on this point, as no reliance, it was said, could be placed on the statement of a man who had been drinking at the *Leather Tankard* all the evening.

However, the news which Old Heinrich had heard was verified next day, for discounts did rise, to the anxiety of many; and his appearance on 'Change was eagerly looked for at his usual hour. But the Bourse closed that day without the customary figure of Heinrich Upmann having been seen there.

Rumours were busily circulated that he was ill. A less charitable report got wind that it was a ruse of Old Upmann to keep out of the way to raise his discount prices. One anxious individual hurried to his office, but could not gain admittance. Then, some uneasiness prevailed; for it was known that he lived by himself, and his neighbours concluded Old Heinrich must be dead. This report was carried to the police next day; and the Commissary proceeded to the premises. But he too failed to obtain admission; and he then determined to break into the house officially; which was done. He found the little back-room locked on the inside. He forced it, and a strange sight met his view. Heinrich Upmann was found in a kneeling posture, crouching over a large chest, which was locked. No traces of a struggle were there; no property apparently missing. The windows were fastened, and no marks existed of thieves having entered the premises. But rumour for once was right. Old Heinrich Upmann was dead! The police concluded he had been strangled, for they found on each side of his throat indented finger-marks, which the doctor declared were made by the powerful pressure of hands, causing suffocation. Here was a mystery to solve for the busy-bodies of Hofengrätz; but no clew was found to elucidate the tragical event.

The official examination of witnesses brought out some of the foregoing facts; but an eye-witness related the following circumstances some time after. The corpse was taken in due order to the Watch-house, and there placed on a couch in one of the dimly lighted apartments before described; and close to it was placed the mechanical contrivance on which rested the right hand of the corpse.

'It was on the fourth night of the watch'—so said my informant—'and I remember it well, for it was my turn of duty. I should have told you, though, that it was the custom on each fresh round of duty to inspect the different apartments occupied, in order to see that none of the arrangements were displaced. Everything that I inspected was in order. It was, as I have said, the fourth night of the watch of Heinrich Upmann's body. The time must have been about one A.M. My room adjoined the apartment wherein he lay. The assistant-apothecary Goetze was discussing with me the subject of suspended animation, and gave several authenticated instances, of which he had read, of the return to life; but none of them referred to the possibility after a death from suffocation as, he instanced, in the case

of Old Heinrich Upmann. He had paused for a moment, when simultaneously we turned startlingly to each other. We had both heard a slight movement in the next room, where Old Upmann's body was resting. We waited for the ringing of the tall-tale bell which would give the unmistakable sign of returning life. It came the next instant; for the bell immediately above our heads suddenly gave a succession of quick ringings! With one accord we rushed to the next room; and in the flickering light of the lamp, we saw Old Upmann's body as I had left it a few hours before. But near it we found another—it was that of Herr Schafstein the notary!

The assistant-physician was summoned; and in the meantime I endeavoured to resuscitate Old Upmann with the remedies at hand; but he was as lifeless as when he was brought in. Schafstein the notary, too, was also dead. What Schafstein's motive was, became the subject of all sorts of speculations, some going the length of surmising that the notary had secretly entered the Watch-house for the purpose of searching the body of Old Upmann for certain documents supposed to be secreted in his clothes! Whether the alarm was given by Old Upmann, none can tell. Some will strongly aver even now that it was a momentary return of his ruling passion of avarice. I have no explanation to give, as Schafstein's body was found on the opposite side of the couch to where the tall-tale was placed, and on which Upmann's hand rested. How he secretly entered the Watch-house is another mystery.

The whole occurrence caused great excitement for some time after; but Koller the tailor always persisted that it was Schafstein the notary whom he saw leave Old Upmann's house that particular night. This persistence increased the mystery; for, as previously stated, the little room where Upmann was found dead was locked on the inside, as also were the windows.

Some time after, however, the police, in completely overhauling the premises, found a curiously hidden door which opened out of the little room on to the landing; and this may have been known to Schafstein, who was intimate with Old Upmann. Indeed, this latter fact, singularly enough, was proved when the police discovered a parcel of valuable securities for money, and among them the acknowledgments of Schafstein's indebtedness to Old Upmann on certain loan transactions.

I should have added, that on the expiry of the allotted time, Old Upmann was interred in the adjoining cemetery, as also was Schafstein the notary; but as no one would pay the fees, the latter's body was not watched. Perhaps, those interested in him thought it more charitable to him not to seek his resuscitation.

#### CHEAP NOBILITY.

A GERMAN publicist has put himself to the pains of collecting a mass of information upon one of the most curious manifestations of human folly and vanity. He has entered into communication with the advertising agents, authorised and unauthorised—probably for the most part unauthorised—who undertake to gratify that greed for titles, orders, and diplomas which is so largely developed on the continent, and is not wholly unknown in England.

Advertisements are often to be seen in foreign newspapers offering to provide duly qualified persons with aristocratic or literary titles; and one of the most successful traders in this peculiar line, if we can take the frequency of his advertisements as a proof, has his office in London, though we should judge from his name that he is not an Englishman. This gentleman, like most of those in the profession, from time to time issues a 'price-current' of titles, diplomas, and orders; and we have had the advantage of studying one of his later issues. According to his own representation, he must have found some means of acquiring the confidence of a number of sovereign princes and of several princelings who seem to have the right to confer social precedences and dignities upon whomsoever they will; and who also pretend to an inherent capacity of founding knightly orders, converting petty schools into universities, and turning any plain 'Mister,' 'Herr,' or 'Monsieur' into Baron or Count.

The more elevated titles of 'Prince' and 'Duke' are unhappily not within their compass, as these are only conferred by the rulers of great states, such as Germany, Austria, Russia, and Italy; and as the sovereigns and exchequers of these states are not under any pressing need of small sums of money, they do no business with the advertising trafficker in titles. It may be supposed that the agent above alluded to is a faithful adherent of the Vatican, as he places at the head of his list, 'Papal Orders and Titles.' Archbishoprics and Bishoprics, we need hardly say, are omitted. The dignities offered to the purchaser are in all cases secular, and proceed from the Pope, not as Bishop of Rome, but as secular ruler of the former States of the Church. The papal Order of St Sylvester (the golden spur) is offered to ambitious Germans for two thousand five hundred marks, or one hundred and twenty-five pounds sterling. The Order of the Holy Sepulchre is cheaper, and may be obtained for five hundred marks less. The degree of a 'Papal Count,' on the other hand, is very much dearer; it is not to be had for less than twenty thousand marks, or one thousand pounds, and the candidate must be able to produce the necessary qualifications. What these qualifications are, is not stated; but they may doubtless be known upon payment of an additional fee.

The Spanish Orders appear to be comparatively cheap, and we presume that the reason is to be found in the general feeling of uncertainty as to the duration of the rival Spanish dynasties. The agent has three sorts at his disposal; and the qualified purchaser may become either a Knight of the Order of Isabella, the Order of Charles III., or the Order of Ferdinand. He can also obtain the Portuguese 'Christus Order' for the trifle of ten thousand marks, or five hundred pounds.

The advertiser is also honoured with the confidence and custom of Mohammedan as well as Christian sovereigns, the Sultan of Turkey and the Shah of Persia empowering him to operate between them and European gentlemen who may be greedy of magnificent Eastern distinctions.

The Sultan, in spite of his chronic need of money, insists upon upholding the Osmanje Order of the First Class at a very high figure; it is not to be procured for less than eighteen thousand marks. But his Ottoman Majesty graciously consents to allow the Third Class of the same Order to be sold by the agent for six thousand marks, or three hundred pounds. The Shah is far less exacting. The Order of the Sun of Nasr Eddin is the very cheapest knighthood in the universe; it costs only five hundred marks, or twenty-five pounds. Any European who purchases it can stick the word 'Chevalier' in front of his surname. There is one drawback—the speculative Shah only confers his 'Suns' in the very cheap shape of photographs; the buyer must subsequently provide himself with the original decoration at his own cost; and the cost is left undefined.

The Emperor of Brazil permits the agent to offer his poetically named Order of the Rose for forty pounds, or eight hundred marks. The knighthood of the Greek Order of the Redeemer, the Serbian Order of Takova, and the Montenegrin Order of Daniloff, are to be had from our advertiser at the cost of fifty pounds each. The domestic Order of the Star, conferred upon members of the court of the Prince of Monaco, may be obtained through the agency for about thirty-five pounds.

Certain Orders which were formerly conferred by a few privileged noble houses, and which are usually believed to be extinct, may be had at a ridiculous figure. Amongst these latter is the Knighthood of Saint Sauveur du Mont Réal. It is in the gift of the Marquis de Rugny, and it is now offered through the agent for five pounds, or one hundred marks; while the Grand Cross of this Order, the very cheapest legitimate decoration in the world, costs only fifteen shillings.

Countships, Baronies, and diplomas of nobility are somewhat dearer than Orders. All the argumentative eloquence and commercial capacity of the advertiser have failed to prevail upon the little republic of San Marino to sell the aristocratic title of Graf, Grave, Earl, or Count for less than fifteen thousand marks, or seven hundred and fifty pounds; the valid 'Barony' of the same republic, however, may be had for four thousand marks; which shows that the dignity of a Count, in the estimate of this unrepugnant petty republic, is nearly four times as valuable as that of a Baron. The agent assures us that a Barony of the Papal See may be had for two hundred and fifty pounds. Some of these titles, we are informed, convey the stupendous privilege of being familiarly addressed by sovereign princes as 'Cousin.'

The gentlemen who covet academical titles are not forgotten by the advertiser; but it is worthy of note that the university degrees upon his book are derived from America. Even the Doctorate of Philadelphia, in spite of recent exposures, is included in his price-current. It is due to him to say that he solemnly demands 'proper qualifications' from all persons who wish to avail themselves of his mediation. The applicant must give a written reply to certain printed questions as to the 'merits' which he possesses, and the 'services' which he has rendered, especially in the direction of almsgiving and assistance to benevolent institutions.

#### ADDRESSED TO A MOTHER, ON HER CHILD'S DEATH.

Ask to forget the Past—except  
Those happy years  
When hope to fear, and joy to grief,  
Owed no arrears:  
Before thy path became as now  
Channelled by tears.

Forgetfulness, to bridge with rest  
The now and then,  
And silence Memory, should she wake,  
To whisper when  
You parted—and no more, on earth,  
Could meet again.

But in thy sorrow there may lie  
Sweet sense of debt;  
Making it faithfulness to Her  
For to forget  
To stir the spices that enbalm  
Her memory yet.

And sacred are the golden links  
Of the long chain  
(Though riveted with scalding tears  
And untold pain)  
By which thou measurest out thy grief  
And count'st Her gain.

Thou wouldst not ask Her, if thou couldst,  
With thee to stand  
Among the thorns and rocks that strew  
This littered strand;  
For thy sweet child rests safe within  
The 'Better Land.'

But dreary is the path thou hast  
Alone to tread:  
And hollow sound thy steps, as if  
The shrouded dead  
Lay tombed beneath, and sable plumes  
Waved overhead.

Healing to common woe, Time bears  
Upon his wings;  
But no catholicon to thee,  
Methinks he brings.  
Sad dirge, and still more sad refrain,  
He ever sings.

R. C.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. To insure return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. MANUSCRIPTS should bear the author's full *Christian* name, surname, and address, legibly written; and should be written on white (not blue) paper, and on one side of the leaf only.
- 4th. Poetical offerings should invariably be accompanied by a stamped and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

## THE ARTS OF TALKING AND LISTENING.

WHEN Miss Burney wrote her novels of Society at the close of the last century, she left it on record that the best conversation of her time was insufferably heavy and stately; but that at a lower level, there were some mysteries of fashionable intercourse which have not wholly disappeared even in our own time. The 'ton misses' she classed in two divisions—the Supercilious and the Voluble. The Supercilious gave other 'misses' short answers: 'No, ma'am;' 'Yes, ma'am;' 'Indeed, I don't know, ma'am'—with long spaces of silence between. The Voluble rattled away on every topic in a breath, from the misfortunes of her friends down to sweetest caps, beautifullest trimmings, and ribbons quite divine; and eked out her ideas with 'Infinite' and 'Prodigious,' in much the same way as even educated people in our own day use 'Awfully' as an unmeaning sign of emphasis. As for 'the man of the ton,' he was still more disagreeable company; a *blasé* air was his characteristic; he was weary of everything, and went to the Oxford Street Pantheon to tell the world his weariness of its music, its talk, and its tea-cups; and his conversation consisted of careless questions, and listless remarks lost in yawns and reveries—like very shallow sand-streams.

After that Georgian era came a period of activity of printed teaching with regard to manners and conversation, when the art of social success was explained, for one shilling or less, in red-and-gilt primers. The little books have shut up and vanished in despair. They found out—better late than never—that they were classed with quack medicines and guides for multiplying commercial capital; and into the *Ilades* of quackery they disappeared. The 'shining in society,' which they professed to teach, is in these days far too dependent upon tangible gold, the recipe for making which was not in the etiquette books. 'Put money in thy purse,' would save many chapters in a new Society primer. But as to the Art of Polite Conversation, which they also professed to know thoroughly, and be able to explain

to all buyers, it certainly ought to be independent of money advantages; yet it is an art that can only be taught in the same sense in which 'duty or cheerfulness, or any other impalpable reality' can be said to be taught—that is, by spirit and precept, rather than by rule.

If we reflect upon the nature of pleasant conversation, there will readily come to mind certain qualities which it ought to possess, and which can be summed up in a few words. It ought to be, in manner natural, lively, and distinct; and the quantity ought to be moderate, for of all monopolies, monopoly of talk is the least endurable. In the matter—which is, of course, far more important than the manner—there should be variety, mutual interest, sympathy, simplicity, candour. Something to talk about, seems to be the great difficulty of talkers. Weather-talk is the refuge of us northerners, favoured by our changeable northern weather; but it is as passing and shapeless as a rain-cloud. Another refuge is to talk of somebody else. As Thackeray says, what would Society do, if it could not talk about the lady who has just gone out at the door? Yet, it is very hard to talk constantly of other people without the sharp remarks that would be cruel if they could be heard; for even very small criticisms are often cruel, as we all know by chance experience; and true hospitality ought not to be able to brook a slighting word of those whom it receives, just as honest friendship refuses to admit even the unkind thought which it would not dare to turn to words within hearing of the friend. A third refuge in dearth of conversation is mutual inquiry, and sympathy carried to a superlative degree, far beyond the bounds of possible sincerity. Mr Punch, who is always among us taking notes, once overheard some of this style of fashionable conversation, and treacherously published his caves-droppings: 'Going to Lady Such-a-one's?'—'Ya-as!'—'So glad!'—'So glad you're glad!'—'So glad you're glad I'm glad!'

The truth is, that pleasant and interesting conversation depends far more upon sincerity and simplicity and absence of self-consciousness, than

upon any natural gifts or studied effort. When there is no self-consciousness, to keep the mind centred in self, either with stagnant vanity of satisfaction, or anxiety as to the impression the all-sufficient self is producing, then there is scope for brightness of thought and quickness of expression. Then comes simplicity, as pre-eminently the greatest charm of any talker, as affectation is the greatest blemish; and with it, too, comes the sympathy of affection or interest. This sympathy is worse than worthless unless it be sincere; it is the sincere desire for information, or for exchanging impressions, that makes pleasant conversation out of commonplace talk. We often feel that people are 'uninteresting to talk to,' when the fault is ours, in selfishly wishing to speak of our special subjects, forgetting that the lives and tastes of others are worth knowing, and different from our own. Scott was wont to say that he had never spoken with any one, even a chance acquaintance in a stage-coach, without hearing something new and worth remembering. The secret of his finding interest everywhere was, undoubtedly, that he himself was a sympathetic talker, more anxious to give a good lead for the other than for himself. The talker who is not sympathetic is always in danger of depriving conversation of its variety; and if he have physical energy enough, he will keep the talk of any number of people to one subject, and that his own.

The conversation ought to be, rightly, the linking together in a larger and slower chain all the many chains of thought of the separate speakers. To hold it long to one subject—unless it be a subject of special interest to the company—is to tie a huge knot in this conjoined chain, and fasten every one's thoughts there. This feat is generally accomplished by that fearful and wonderful outgrowth of Society known as a Bore. There is no need to describe this terrible being, who is as thoroughly good-natured, faultless, and innocuous in his own self, as he is afflicting to his friends. It is enough to state that the Bore is eminently respectable, often learned, indefatigable, unobtrusive, and all-absorbing in conversation. Even in fiction, this dreadful but blameless character has never been described; it has to be taken on faith that this man, or that, was a Bore; to develop the character would be to bore the reader.

There are various wise saws that advise unsociable silence to the possessors of tongues. We are all familiar with, 'Speech is silver, but silence is golden;' and fortunately, most of us are of opinion that the saying only holds good for such unhappy occasions as quarrels and the misfortunes of our friends. Other epigrams point to silence as a mask for ignorance, or a discreet stopper to be put upon the dangers of a little knowledge. One imitated from the Greek of Palladas advises:

If you, my foolish friend, by chance 'mid learned wights are flung,  
To seem a sage, you only need—Do what? Why,  
hold your tongue!

But though the following of this sarcastic advice would be clever, the foolish friend would be more honourable, as well as better company if he tried to learn something from the learned wights. Dull company would indeed be plentiful, if the golden-silence proverbs did not find human tongues too strong for them; and the silence that exists—that

is, not the listening, but the stolid listless silence—is often a mark of dullest metal rather than of gold. 'Comprehensive talkers,' says George Eliot—one of the most observant of talkers or listeners—are apt to be tiresome when we are not athirst for information; but, to be quite fair, we must admit that superior reticence is a good deal due to the lack of matter. Speech is often barren; but silence also does not necessarily brood over a full nest. Your still fowl, blinking at you without remark, may all the while be sitting on one addled nest-egg; and when it takes to cackling, will have nothing to announce but that addled delusion.

But to return from the subject of silence to our own province, which is not the art of silence, but of speech: there have been—and there are still—some brilliant talkers who seized the talk as a monopoly, but who neither kept it upon one subject, nor in any sense bored their friends; and this because, by exceptional wit or wisdom, they could not help but talk, and talk well, so that it was good fortune to listen, and impossible to wrest from them the attention of others. Talent, as Lord Lytton well said, does only what it can; but Genius what it must. And many a man has been a genius of conversation in the circles of his friends. It was true of Macaulay that few others got a hearing when he was present. His vast resources of knowledge made his conversation sound like a versatile never-ending book; and his memory being of almost incredible power and precision, no one was able to record his table-talk, for it would have needed such another memory as his. A great critic of those days, called him the troubadour of dining-rooms, rich in narrative, charming the company with noble speech, but neither witty, like Jerrold; nor humorous, like Sydney Smith; nor poetical, like Moore; nor dreamy, like Coleridge. Sydney Smith, who often sat at the same board with the talkative historian, was quite as voluble, with less of information, but more of wit. 'We both talk a great deal,' he himself once acknowledged, with a laugh; 'but I don't believe Macaulay ever did hear my voice. Sometimes, when I have told a good story, I have thought to myself: "Poor Macaulay! he will be very sorry some day to have missed hearing that!"'

From Sydney Smith's bit of pleasantry, it is clear that Macaulay, like many other great talkers, was a bad listener. If few can equal him in talking, all can excel him in listening; and there are few social arts more truly kind, attractive, and winning, as well as more really valuable, than that of being a perfect listener. A perfect listener is not one who feigns interest, and is secretly indifferent. Unreal interest is always transparent. We detect the fraud in the tone of the interjections; and if interest were true, and the listener alive to the conversation, interjections would give place to words of comment or inquiry. Interjections are, in fact, disappearing from good conversation; and they are always rare in the speech of the quick-witted and educated, amongst whom they are not needed as substitutes for ideas. It is said that women have more social success than men, because they are better listeners; but, for ourselves, we are afraid fair listeners deal largely in unreal interest, and betray their want of true pleasure by a want of resource in following

the speaker's side-courses of thought. At the same time, we must admit that many conversations are hopelessly uninteresting, except to the one that is the leading speaker; and then we yield the palm to women for their tact in turning the talk. It is too often forgotten that there is a pleasure in speaking, and that we need not fear to appear dull if we leave most of the conversation to those whom we desire to entertain. It was said of the late Emperor of the French, when his career was sifted, and his life analysed by public opinion after its sudden close, that he owed a large part of his success, socially and as a diplomatist, to his habit, not of being a good talker, but of being an excellent listener.

Talking and listening, with their immense stores of pleasure, are the easiest of all acquirements, if a kindly genial spirit and the candour of nature take the place of self-exaltation and studied rules and forms. We are speaking, of course, not of Macaulays, Coleridges, and Sydney Smiths, but of ordinary mortals, who have it in their power to swell the common property of cheerfulness, simple wisdom, and true judgment. And as we believe that not only charity but every other good thing should begin at home, we protest against the too ordinary mistake of thinking any talk good enough for 'among ourselves at home'—anything good enough for the one spot in the world that we can most easily brighten, and the one circle that is most dependent upon us. It is true that there is an air of familiar rest and ownership in the very silence of home-rooms; there is no need there to keep talk going. We like to be at work or to recreate ourselves in our own way, just conscious of the restful presence of those who are dearest to us. When Charlotte Brontë, always sorely tried and weary, was residing at the Belgian school, there was one of her true touches of observation in her noting it as a home-like pleasure, that she was not expected to converse all through the evening; but might be silent as long as she liked. But at home, as well as everywhere else, there is a time to speak as well as a time to be silent; and bright gaiety of conversation, or even a pleasant way of saying what has to be said, lightens many a load for those who have burdens of anxiety to bear.

It is also to be regretted that in another way home talk is neglected. There is a false shame, or a bond of cold custom, that holds back expressions of the gratitude, trust, or affection which the heart really feels. Often beside a deathbed, the bygone years may be bitterly counted up, wherein was sedulously hidden the tenderness in little words and deeds, which might have comforted the whole course of the life now ending; or, all too late, when the grave is closed, truth rushes out in a torrent of love, where love, but half realised before, shrank from transforming itself daily into those little deeds and passing words, which are, after all, the triles making up the sum of a service of love that is not little. The candour of true friendship is a better thing to make habitual than any brilliance of speech; indeed, mere cleverness of speech is not what we are advocating in commending as a neglected study good talking and listening. Those who are ambitious of the distinctions of wit and brilliance, must seek elsewhere for hints. They may find plenty in the records of the old court of

France and the *salons* during the monarchy—probably the place and period in which extreme polish of witty conversation was most widely cultivated. Even a boy-king, at that time, did not disdain to converse daily for an hour with Madame de Choisy, that he might acquire the art of repartee without which a gentleman would be incomplete. But there are many more profitable studies than that of conversational turns and sharp answers; and tyros in the art ought to be warned by the example of the hero of *Happy Thoughts*, ambitiously attempting to make his dictionary of repartees, beginning with an Abbé and an Abbot, and hoping in time to know what to say to a Fakir, a Footman, and a Fool.

## MY LAST DETECTIVE CASE.

### CHAPTER III.

It was late when I got home; but Mr Hellip was still up, which was not usual with him; so, hearing me enter, he invited me to step into his room. He explained that having had a long nap in the evening, he could not hope to go to sleep, but was quite glad that it had happened, so, as he wished to congratulate me on my success. I was astonished at such a remark, and asked him his reason for saying so.

'Only that everybody was talking about it in the omnibus to-day,' he replied; 'at least three or four persons said the Upper Broughton Street mystery was likely to be cleared up. I felt quite proud to hear the way in which they all spoke of my friend Mr Nickham.'

'I don't want to be rude, Mr Hellip,' I said; 'but your acquaintances in the omnibus had no more sense than your friend Mr Nickham, and I begin to think he is a perfect flat.'

'Why, you don't mean to say that you have not found a clew?' exclaimed Mr Hellip. 'Surely such a man as yourself'—

'Oh, that will do,' I said, interrupting him; 'we will not have any compliments until they are deserved.' With this, I left him rather abruptly; for I was anything but pleased at his language; I felt as though I could not tell whether he was in earnest or bantering me. I believe I have mentioned before that I was not particularly intimate with Mr Hellip, and his joking did not seem to me to be at all in good taste.

I and others before me had tried various schemes, which came to nothing, to trace out the Upper Broughton Street mystery; but I have not troubled the reader with any particulars of these failures. I never knew our Force at such a loss; none of our men seemed to have an idea in their heads; every hint they gave me was absurd or worn out. I should think if I was advised once to look after little Mr and Mrs Brake, or to arrest the poor old housekeeper with her son Bill Jenkins, I was urged to do so five-and-twenty times.

Bearing in mind the description given by Jenkins of the visitor at Daryett's, I got into the habit of staring into the face of every one I met in the streets or sat opposite to in an omnibus, to see if I could trace any resemblance to the face and figure I had conjured up in my mind. Twice—although I am almost ashamed to confess it—I positively followed what turned out to be very respectable people, because they looked a little like this man.

One proved to be a Quaker, in a large way of business at the West End; while the other lived at Richmond, and I actually went all the way there with him, merely to find that he was a gentleman of private fortune, who had dwelt there for forty years. I merely tell this to show how ready I was to be impressed by such a story as Jenkins told me.

I have said that I always made a friend and adviser of Mrs Nickham, and never did I slight her advice without being sorry for it. Now, on this night when I got home, late as it was, there was my supper ready to the minute. She had a wonderful way of managing in that respect, and she was sitting by the little fire—for the evenings had grown chilly now—working as usual. There had been a small rain falling as I came home, and I was rather uncomfortable; so she chatted until I had eaten my bit of supper and was sitting in my dry slippers, my pipe lighted, and my cold whisky-and-water at my elbow, so that I began to feel all right; then she changed the conversation by saying: 'You have been very careful, I suppose, Dick, not to mention what steps you have taken to any one, especially about this spiritualist business?'

'To be sure I have, my dear,' I answered. 'It is bad enough to know ourselves what a fool I have been, without letting all the world know.'

'Not even your inspector?' she went on.

'The last person in the world!' I said. 'To tell him would be like proclaiming it at Charing Cross.'

Mrs Nickham went on with her work again; but I know her way—of course I do—and I was quite aware she had something more to say. 'I suppose you have not told Mr Hellip that you have been to a spiritualist?' she resumed, after a pause; and I said 'No!' to this as energetically as to the other question.

'You are quite certain he knows nothing about it? May you not have dropped a few words before him, that?'

'Nothing of the kind,' I interrupted—'nothing of the kind, Jane. Mr Hellip has had a great deal too much to say about this business; and what with his jokes and his compliments, I have scarcely been able to be civil to him.'

'Well, Dick,' said my wife, changing her tone again, 'what are you going to do about your friend Charley's appointment?'

This led to a very interesting discussion; the result of which was that we both agreed I should arrange with Charley for my attending the meeting of the next night, unknown to the visitor. I thought she had intended to say something quite different from this; but knowing she always had a reason for what she did, I took no notice.

I met my friend Charley at the *Two Gridirons*, as appointed, when I told him what I intended to do, and what assistance I wanted from him. He could not promise all I asked; so I had to go with him to see the principal. I found this was a very decent old gentleman, who, when he heard my business, was quite willing to assist all he could, until he found I wanted to arrange the answers which were to be given to the visitor. He fairly puzzled me then. He declared that it was wicked and sinful to pretend to have revelations and visions which did not exist. Why, bother it! I thought it was just by doing this

that he and his mates got their living. I had to take very high ground, and point out what an awful crime had been committed, and what a responsibility would rest upon his conscience if he refused to assist me, before he consented. It was but little I wanted done, after all; it was only to lead to further questions on the part of the visitor; and if there was no harm in his inquiries, he could not come to any harm through them, that was plain.

I left home a good while before the time fixed for the interview, which was eight o'clock, as I had to dress and disguise myself before attending the meeting. I took the materials with me in a bag; and by the time I had put on an old dressing-gown which the principal lent me, and with the assistance of Charley, had made myself up with a white-gray wig, white whiskers, some extra lines about my face, and a pair of spectacles, I don't believe any London prig would have known me. So long as I didn't speak, I might have passed for anybody but myself with the sharpest of them, and I reckon the London thieves are as quick a lot as any in the world. The experiment was to come off in the front parlour, which opened with folding-doors into the back-room, and in this latter I was to be sitting at a table as if I was writing. I was placed so that the visitor would be in full view; while, as the only light in my room was behind me, I was comparatively in the shade, and ran but little danger of being discovered.

Punctually at eight o'clock there came a knock at the street-door.

'Here he is!' said Charley; and I went to my seat.

'Mr Nickham,' said the principal hurriedly, 'I am lending myself and my lofty science to deceit. I am not at ease in doing so; and I hope you will always remember that it is only for the sake of justice and to clear the innocent, I have done so.'

There was no time for him to say any more, or for me to make any promises, for the room-door opened and the stranger entered. He took off his hat, and nodded with an easy swagger, first to one, then to the other, as if he had known the people for years. He either did not notice me at first, or thought I had not much to do with the business, so he did not trouble himself about me. But I saw him. By all that's wonderful, it was my lodger, Hellip! It was well for me that I was in the shade, that I wore spectacles, and was painted and made up; for if I had been as visible to him as he was to me, my stare and gasp must have betrayed me. For a few seconds I did not hear what he said, although he was talking rather loudly; I was so astonished at my blindness at not having recognised the description of the man whom I saw every day—a description so exact, that I ought to have identified him, as I now saw, if I had met him casually in the street. Now I understood all his artful inquiries, all his interest, and all his assumed good temper in speaking of the Upper Broughton Street mystery. He was the borrower! Aha! I saw the whole transaction clearly enough now. This mysterious sum of money which the accountant could not trace, must have been lent upon a bill accepted by this man. The bill was nearly due; Daryett had refused to renew—this was proved by an allusion in his book

as to what he intended to do with it—Hellip had killed him to get possession of the bill, and so to save himself.

All this flashed through my mind much quicker than it can here be read, and then—the first shock of surprise being over—I was as cool, and had all my wits about me as completely as when I first entered the house. At the same time, I was quite aware—no one better—that it was one thing to feel certain of any fact in our business—and I never felt more certain of anything than I did of this:—and quite another to have legal proof of it, or to be justified in apprehending a man.

The séance—as I believe it is called—proceeded, Charley on this occasion only pretending to go into a trance, and in answer to the questions put to him by Hellip—of course through the principal, to keep up the delusion—he returned such answers, as arranged with me, as completely staggered my lodger. He did not say anything about a murder, or of Upper Bronghton Street; he only wanted to find out something about a valuable paper which had been lost; but Charley in all his answers referred vaguely, yet unmistakably, to some dreadful crime in connection with the paper, so that Hellip was evidently troubled and alarmed. He varied his questions, endeavouring to get away from this ominous subject; but of course he could not succeed; and then the principal asked Hellip point-blank if the loss of the document was in any way connected with a murder. Hellip forced a hollow laugh, but, as I could see from where I sat, was forced to moisten his lips before he could reply. ‘Murder! Ha, ha! Not at all,’ he said at last. ‘The paper was lost, I expect, on a racecourse.—I won’t trouble you with any more questions, thank you. I had no idea your power enabled you to go so far back. I am glad, however, that I came. Good-night, gentlemen.’ Saying this, he hurried off, leaving me quite convinced he was the man I wanted; while my companions, as I afterwards found, were greatly prejudiced against him.

‘I have aided you, sir,’ said the principal, ‘although not with much good-will. Yet the result has been so unfavourable to the man who has just left us, that I feel I was justified in doing so. By means which you do not understand, and would perhaps only ridicule if I explained them, I probed the man’s mind while he was here, and read his wishes, he not suspecting me. He is a bad man. Whether he has committed the crime you are investigating, or not, I cannot say; but in any case, he has so wicked and cruel a heart that I never wish to see him again.’

I agreed in the estimate of Hellip which the principal had formed; but bad as we might think him, we had no evidence yet upon which I could act; that was the unfortunate part of the case.

I went straight home to tell Mrs Nickham what had happened, and to think over the next best step to take. I let myself in with my latch-key, as, supposing Hellip to have reached home before me, I certainly was not desirous of seeing him before I had made up my mind. The best thing which had suggested itself to me during my ride home was to consult Mrs Brake, telling her my suspicions, and so ascertain if she could give me any tangible evidence.

Seeing a light in our front parlour, which was not often the case, I was about to step in there,

when Mrs Nickham, who had evidently heard me enter, opened the door of our usual sitting-room, which was at the back of the house, and called to me. I went at once to her; and as she carefully closed the door, I was struck by a certain excited, I may almost say wild look in her face, very different from her usual expression.

‘What is the matter, my dear?’ I began; but she put her finger to her lips, and I was silent directly.

‘Speak low, Dick,’ she whispered. ‘You can’t be too careful, for there is no knowing who may be listening at our very keyhole.’

‘Ah, Jenny, you are right there!’ I returned in the same tone; ‘although what makes you suspect anything or anybody, is more than I can understand. Go on.’

‘You must sit down and listen for a few minutes, Dick,’ she continued. ‘I have found out a great deal while you have been away. I can see by your look that you have something to tell me also; but you had better hear me out, Dick. You remember my asking you if you had ever told any one, and especially Mr Hellip, of your visits to the spiritualist? Well, when I asked you, I was quite certain, from some words he had dropped, that he *did* know you had been there. He did not mean me to see this, you may be sure, but I saw it at once. And then it at once flashed upon me that here was the very man who had been described to you—the same broad fleshy face, the same small, cunning, restless eyes, and the same fixed grin. I knew it; yet I did not like to tell my suspicions, especially as I had found something which I hoped might give me a fuller clew.’

‘Found something!’ I repeated. I was tremendously interested in my wife’s narrative, as you may guess.

‘Yes, Dick. It was only half a leaf of crumpled note-paper, which I picked up on the stairs,’ said Mrs Nickham; ‘on it was an address—“Mr Lawrence Jacobs, Stobble Street, South-wark.”’

‘Excuse the interruption, my dear!’ I exclaimed; ‘but I know old Jacobs. He calls himself a pawnbroker, as he certainly is; but he is also one of the most notorious receivers of stolen goods in London, yet so artful, that we have never been able to make anything of him. I beg your pardon, my dear—go on.’

‘On the back of this paper,’ continued my wife, ‘was scrawled: “DEAR VALLY—This party is all right; the wife had better go.—HOCKING.” Now, I knew Hellip’s Christian name was Valentine, so the paper was clearly for him; and I was confident that it was advice respecting getting rid of some of the stolen property by means of his wife. It, of course, occurred to me that this writing would be missed and looked for, and if not found, some suspicion might be excited, so I copied the writing, and dropped the leaf as nearly as possible where I had found it on the stairs. I was only just in time; for as I kept my eyes and ears open, I saw Mrs Hellip come down presently, look anxiously about, then pick up the paper, and hurry back to her room. Mr Hellip went out alone; but very soon after he had gone, Mrs Hellip went out also. There was no one in the house but Anne, so I told her to put the chain up; and having my bonnet and cloak ready, I slipped out after Mrs Hellip. I easily kept

her in sight until I saw her hail a Borough omnibus, into which she got. I was looking round for a cab, when who should come up but Long Joe—the cabman, you recollect, Dick, whom you spoke up for in the bad half-sovereign case?

I nodded. I remembered the case well enough, Long Joe would have had a twelvemonth certain, if I had not happened to have known something of him; but I did not interrupt my wife.

"Joe, I says," she went on, "I want to follow that omnibus to the Borough." "Right, mum," he says; "you shall follow it to Jericho, if my horse don't give out." Well, we kept it in sight till Mrs Hellip left it. I told Long Joe to wait for me; and I followed her into Stobble Street, as I expected.

"This is really growing interesting," I said; "but I beg your pardon, my dear."

"She went into the pawnbroker's—Jacobs was the name. I followed her," continued my wife—while I drew a long breath, as people do who are hearing an exciting story—she entered one of the boxes; I entered the next, but kept at the back, determined she should be attended to first. A young man came up to her; but I heard her say that she must see Mr Jacobs himself; and then the master came. No one supposed there was anybody in my box, so the young man went to another part of the shop. There was a little muttering, and then I heard her say: "Twenty pounds; it is worth fifty." I stepped to the front, and looking boldly out, as though I had just come in, saw that she was handing him a watch, which I recognised from the description as the one stolen from Upper Broughton Street."

"My eye!" I exclaimed, quite involuntarily.

"The pawnbroker hastily scrambled it up, but not until I had seen all I wanted," resumed Mrs Nickham. "He scowled savagely at me; but I looked as innocent as a baby, so he thought it was all right, and called his young man to attend to me. Owing to the partition, Mrs Hellip, of course, could not see me from her box. The young man came, and— Would you believe it, Dick? I had not till that moment thought of what excuse I should make. I had to pawn something, and I offered the first thing I thought of. What do you think it was, Dick?"

"Why, you don't mean to say you had to bowl the hoop?" I replied. "To bowl the hoop" is to pawn the wedding-ring, and the term is generally understood in professional circles.

"That's just what I did!" exclaimed my wife. "He lent me five shillings on it, which I think was pretty fair."

"Quite liberal, my dear," I said. "But about Mrs Hellip?"

"Well, there is not much more about her," returned Mrs Nickham. "While the young fellow was making out the ticket and all that, I saw the master pass twenty sovereigns over to her; and then she went out. I got into Long Joe's cab again, and came home. Here is the ticket, Dick, and you must get the ring out to-morrow."

"All right, my dear," I replied. "But now you must hear what I have to say."

"Not yet," interrupted my wife; "there is just a little finish to my story. Did you notice a light in the front parlour?"

"I did."

"Well, then," she went on, "there is a friend of yours in there. You had better go and see who it is; and as Hellip is up-stairs having his supper, you may perhaps get an idea of what I think you ought to do."

## PAVEMENT PORTRAITS.

### A LIFE-GUARD.

LOOMING statuesquely obstructive, at the far end of the smaller division of the tunnel-like gateway into St James's Park at the Horse Guards, backed by a sort of white sheet of fog, hanging thick over the Park, this portrait, one dull November day, confronted me, as I turned from Whitehall to make my way to London's little *Champ de Mars*, embellished with its two captive cannon, and frowned down upon by the hideous chimney-like column of the Duke of York.

Very grand was the outline of this man of war—this life-guardsmen. Two long, strong, and straight limbs supported a well-knit, broad-shouldered body, surmounted by a proud and firm-set helmeted head, adorned with a nodding plume, which, from time to time, disturbed the murky air by reason of the conceited jerks and tosses of its owner. The figure looked black as I approached it along the before-mentioned little tunnel; but when I had, with some difficulty, passed the giant, and emerged into the comparative light of the Park, what a change I saw on looking round! The nodding plume was snowy white, the helmet was a glorious mixture of glittering brass and steel, and the scarlet tunic suggested flame and blood to my innocent civilian mind. The hands, encased in the whitest and wickedest-looking gauntlet gloves, seemed made and ready for deeds of daring; the thighs, displayed by the tightest buckskins into which man's nether limbs were ever forced, suggested strength enough for Mars himself; and the enormous jack-boots, with their great cruel spurs, conjured up visions of carnage and rapine.

"A valiant soldier. A man who's hired to kill his country's enemies." Such was this guardian outside the "Abandon-hope" sort of gateway under a clock which never goes wrong, but somehow always seems to be "on strike." Albeit at the time of which I am speaking this soldier, "armed with resolution," was merely explaining to a thick-headed coachman, driving a sort of pill-box brougham, containing an old lady, that he could not drive through the middle archway, sacred to the carriages of the Court and Commander-in-chief. The driver was obstinate, and seemed to doubt the authority of the sentry; and I went near enough to hear the concluding words of that adamant guard: "I beg your pardon, but my duty is to prevent carriages coming this way; it's no use, you *can't* get through; must go round the other way." With that, the Guardsman took one stride and a half, and planted himself right in front of the lean Rosinante which was between the shafts; and I really thought, for a moment, that the poor quadruped would have gone on its knees before this blazing vision of scarlet and white; that the Jehu would get off his box and fly the scene;

and that the old lady inside, who up till now seemed to have been fast asleep, would wake up and scream. The incident ended mildly, however; for the driver pulled himself together, and turned the dejected horse round, and drove the pill-box off into the fog, and was no more seen.

This sentinel of six feet six smiled a haughty smile at me, as though seeking approbation of his successful defence of the sanctity of the carriage-way. Then he drew the ends of his moustache to the front of the brazen chain which lay along his chin, and said: 'Some people want a lot of talking to before they can be got to understand a simple regulation. I have to turn off no end of carriages from this gate; but even carriages-and-pair go away with fewer words than it took to explain to that *gardener* that he couldn't get through here.' Although there was ineffable scorn in the epithet '*gardener*' which he applied to the unfortunate coachman, there was a good-natured twinkle in the soldier's eye as he spoke—a twinkle which prompted me to offer him a cigar.

'I'm much obliged, I'm sure, sir,' he said, as he took the proffered 'weed' and inserted it into the bosom of his tunic, between the third and fourth buttons from the top. 'I'll smoke this when I go off sentry. It'll be something to do.'

'I suppose you have a dull time of it when you are not on duty?' I said.

'Well, yes; there isn't much to do when we're down on this "Queen's guard." But I'm better off than most of the men in that respect, for I've got an occupation. I draw.'

'Draw!' I returned, surprised. 'What do you draw?'

'Oh, all sorts of things. Look here!' With that, the sentry strode to the side-walk, and pointed out to me some designs roughly scratched on the wall, representing, apparently, companions in arms. 'These,' he said, 'are my work; but a sword-point isn't the best thing to draw with, and a stone wall is hard to work on. But I've lots of drawings, properly done in Indian-ink and water-colours, which I might perhaps have a chance to show you, if you like.'

I said I hoped to have an opportunity of seeing them some day, and with the expression of that hope, I moved away, praying for a quick subsidence of the uncomfortable sensation in the back of my neck caused by too long looking at the giddy height of that glittering helmet.

Some months after this first interview with my artist Life-guard, I was going along Oxford Street, at a time of the day when the pavement in front of Mr Peter Robinson's shop was thronged with people, ladies principally, all on the pleasant business of shopping bent; and it was difficult to make progress through the crowd of millinery and muslin worshippers between the end of Great Portland Street and Regent Circus. While carefully picking my way, so as to avoid, if possible, disturbing any of the fair idolaters, I became aware of a longer pair of legs than mine, whose every movement caused a jingle of spurs—awkward things in a crowd like this—evidently engaged in the same puzzling task of keeping free from entanglement with the daintily costumed multitude; and looking up, I saw the stone-wall-engraving sentry of St James's Park. He nodded familiarly as he caught sight of me, and made a sign with his head which looked like a

beckon, doubtfully given, as if fearful of his own familiarity.

I turned, and followed the red-jacketed giant into a public-house; and when once safely in the bar, I was saluted as follows: 'Well, how are you, sir? I didn't speak to you outside, for people look so when fellows as conspicuous as me fall talking to civilians, and I thought you wouldn't like it. But I've got some of my drawings here, and may be you'd like to see them. They're not the best I've done; but they're fair enough; and as you seemed to have some idea yourself as to what's what of this sort of thing, I thought that you wouldn't mind stopping a bit to see these specimens. No harm done, I hope?'

'Harm? No! What harm should there be?' I replied. 'I am glad to see you; and should like to look at the drawings you have.' I wondered, as I spoke, where the drawings were; for my companion was so tightly buttoned up in his scarlet jacket and blue, red-striped continuations, that I could not see how any drawings could be concealed about his person. However, he soon enlightened me, and pulled down from under his jacket a perfect breastplate of cartridge-paper in small square sheets, on each of which was, I found on examination, a really clever sketch. Most of the subjects were military, and of these the majority were imaginary incidents in the career of a Life-guardsmen. Maid-servants, masters, mistresses, policemen, street-boys, and Volunteer officers, were all treated in a humorous and spirited way; and some characters in an Irish play at the Adelphi, which the artist had lately seen, were wonderfully done.

While I was looking over the sketches, the Life-guard looked at them too, and the effect they produced upon him was curious and amusing to witness. He regarded his own work with undisguised admiration, expressed in a series of conceited attitudes, which spoke plainly as words his approbation. There was the pose of calm appreciation—bolt upright, legs close together, one arm akimbo, one hand stroking the moustache—as much as to say: 'Yes, that's mine, *all mine!*' that of interrogative wonder—body slightly bent, hands behind tapping his back with his riding-whip—as if asking: 'What do you think of *that*? Beat it if you can;' and that of sympathy with his own wit—legs negligently crossed, one spur pointing upwards, and a languid leaning of his body against the bar, his closed mouth wreathed with smiles, as if moved to mirth at his incomparable funniness. These attitudes, as I have intimated, betokened great conceit in the man; but in such a splendid creature, conceit was no more out of place than pride is in a peacock when it spreads its tail.

As I have said, most of the subjects chosen were pertaining to the life of soldiers; and observing this, I said to my friend: 'You seem very fond of your life. May I ask, if not a rude question, how you came to enlist?'

'Oh, I don't mind telling you a bit. There's nothing very wonderful about it. It wasn't money, or the want of it—or love, or the want of that, that made me become a soldier. There's lots of chaps in our regiment as would have a pretty yarn to spin, if they were to set about telling you how they came to enlist. There's the son of a Sussex parson who was made a soldier through a young schoolmistress in his father's village. There's the

son of a noble Lord who joined ours because of the money-lenders or something of that sort. There's more than one who's taken the shilling because he's broken heads as well as hearts; and I daresay there's many of them did it because they didn't know any other way of keeping themselves straight than to bind themselves with the Queen's Regulations. But it wasn't so with me. I joined because I thought I'd like a soldier's life; and so I do. I was apprenticed to a firm of picture-engravers; and when I'd done my time, I found I'd grown so much bigger than every one else in the shop, that I thought I'd do something with my height like. Every one was obliged to look up to me, and I thought that I'd give them something worth looking at. I always liked the uniform, and I really think that that was the main reason I enlisted. At least, I don't know any other; and I don't repent my choice. I'm in for twelve years; and at the end of that time I shall only be thirty, quite young enough to take to my old trade, if I like. But I shall never have to do that; for I hope to be able to make a living by that time at these sort of things. I'm very fond of music too; I play the piccolo *properly*, and it'll be hard lines if I can't manage to get on at one if not both of these arts.'

Another surprise! Music must now be added to the accomplishments of this very accomplished trooper. He was getting almost beyond me; and dreading lest he should begin comparing the merits of Mozart and Mendelssohn, I brought my companion back to the subject of his sketches, two or three of which I bought of him.

As I rolled up my little purchase, my artist-musician Guardsman asked me what I thought of the position of affairs in Ireland. This was too much. I could not and would not add the craft of politics to the many endowments of this happy soldier 'portrait,' so I somewhat hastily left the bar and its brilliant temporary ornament.

## JACQUES.

AN EPISODE OF '91.

BY DAVID CHRISTIE MURRAY.

### CHAPTER I.

BROAD, bright, summer sunshine over the quaint old town of Vieuxchâtel; and broad, bright, summer sunshine pouring in a dazzling flood across the floor of a squalid chamber in the topmost flight of a house of seven stories. In the squalid room, one broken chair, one broken table, one tattered paillasse—from whose edges the straw peered raggedly—and broadcast on the floor one tattered human figure—a stalwart figure, and not unhandsome, in spite of rags; not unhandsome, in spite even of the signs of constant debauchery borne by the bearded face, or the premature gray sprinkled about the moustache and the untidy hair. Broad summer sunshine streaming full upon the sleeper's face failed to awake him; but his breath was stertorous and disturbed, and he moved and muttered often and uneasily. The man was evidently but the wreck of what he had been; but for all the drunken sleep, the signs of debauchery, the rags he wore, and the squalor of his abiding-place, there was still the touch of a better past about him. The pose of his figure was graceful; and his features, though their first clear-

ness of outline was lost, had still a trace of manly beauty.

It was not an early sunshine which poured into that lofty chamber. The early sunbeams, six hours ago, had touched the discoloured ceiling, and had stolen slowly lower and lower, until they now lay full upon the sleeper's face. As the sun mounted, and its light grew nearer to the edge of the bleared window, it revealed a scrap of paper, and on the scrap of paper a printed name, a name of terror in those days—MARAT. The scrap was crumpled, but from its topmost corner peeped the words 'Salut Public.' Beside it, but nearer the window, and still in shadow, lay the means employed in those days for the preservation of the public health, a carabine and a sabre, and between them a tattered Phrygian cap, misnamed 'of liberty.'

Whilst the sleeper stirred and muttered in his broken slumber, there came so loud a knocking at the door that he started upright, and with half-opened eyes stared about him in alarm; but in a moment severing reality and his dreams, he cried, with something of a rollicking, desperado air, to the knocker to enter. An old woman, with one heavy *sabot* in her hand, and the other upon her right foot, obeyed his order.

'You sleep too soundly for health, Citizen Jacques,' said she, leering at him, and shaking the *sabot* in her hand towards the door, to indicate that its application had been necessary to awake him. 'Brandy may be a very good doctor, but it is a bad bedfellow, Citizen.'

'What hour is it?' demanded the man sulkily.

'It is within an hour of mid-day,' the old woman responded; 'and you should have been away two hours ago to Postal for Monsieur le Notary.' She dropped her heavy wooden *sabot* on the floor as she spoke, and set her foot in it. 'Come man, hurry!'

'Why so much noise?' said Jacques, more sulkily than ever. 'The notary will be in time.'

'It is an odd thing, Citizen,' said the old woman, with a look of malicious enjoyment in her eyes, 'that you, of all men, should be chosen for such an errand.'

Citizen Jacques turned upon her such a look; that the chuckle she had begun died upon her lips. She lowered her eyes, and muttering that she had other things to do than to waste her time there, she left the room in apparent discomfiture.

'Ay,' said Jacques, muttering to himself savagely, 'it is an odd thing. The Citizeness has reason. But I—what was I ever, but a *vaurien*, a fool? You have kicked over your basket, Alnaschar, and there is no market where they will buy the pieces.'

He shook himself together with the gesture a dog uses on leaving water, stuck the cap of liberty on his head with a rakish and defiant air, set his carabine and sabre in a corner of the room, and left the chamber, securing the door behind him. A single flight of stairs traversed downwards, brought him to the street; for though on one side the house was seven stories high, the hillside on which it was built rose so precipitately, that the rambling and picturesque building presented a frontage of one story only to the village road. The whole place drowns in the strong, pure sunshine, and there

were but few people abroad. The village cobbler sat in his stall; the village woodcutter lazily plied his trade in a shady corner; the grocer lounged at his own door; and to each and all of these, as he passed, Citizen Jacques lunged out a 'Good-day,' which had somehow a note of defiance in it. It was noticeable that cobbler and woodcutter and grocer all displayed something of a nervous alacrity in responding to the salutation; and that there was even a propitiatory air about each of them, and a propitiatory tone in the voice of each as they returned the bullying salutation.

The plain fact was that Citizen Jacques, little as he might look like it, was a power in the village. In those days, power lay within the grasp of any man unscrupulous enough to wield it. They were days when the reckless French wit conjugated the verb to suspect—'I am suspect, thou art suspect, he is suspect;' days when no man's life, however virtuous, honourable, patriotic he might be, was worth a minute's purchase, if any ragged and disreputable scoundrel thought it worth while to denounce him to the Committee of Public Safety. And ragged, drunken, and disreputable as he had grown, Jacques Lamballe was esteemed an honest patriot, and his word was weighty. The Republic suited Jacques, as it suited many another person of his type. There was no need for a good patriot to distress himself overmuch with work in those days. A patriot whose affection for his country was beyond dispute or cavil, might, without much difficulty, levy black-mail upon patriots of a type less pronounced. Jacques' wants were few and easily supplied. They were readily supplied also; for though as yet he had denounced nobody, he was pretty generally supposed to be ready to denounce anybody, and it was well to have a friend at court. Not a tongue in the whole wide land of France dare wag against the prodigious tyranny of that mad suspicion; not a head shake against it, for fear it should shake itself off into that grim red basket which lay at the feet of the great overworked national executioner.

But as Jacques walked along, credited by all who watched him with designs of village statecraft, he had no thought of the safety of the great Republic in his mind. 'You have reason, Citizeness,' he said to himself; 'it is an odd thing that I, of all men, should undertake our good Citizen Thurot's business in this matter. My handsome Camille shall be betrothed to-day. Eh well! But when shall my handsome Camille be married? You were scornful, pretty Marie, this three years since, when perhaps I was as good a match for you as handsome Camille himself; and the handsome Camille carries a head no safer on his shoulders than any other citizen of the good Republic, one and indivisible.—Behold me!' cried Citizen Jacques aloud, being clear by this time of the village street, and alone in the wide fields, with none in sight. 'What I am, Mademoiselle, you made me. I am not such a fool as not to know what I am, and I do not bear so poor a heart as to forgive you who spoiled me. And you, Monsieur le Capitaine, had your share in it. For who but you came between us? I was as handsome a man as you, my good Captain. I had better blood in me, if that were worth anything in these days of a good Republic, than ever ran in your veins. And now, see what I am become—a thing for myself to

loathe, and the dogs to bark at! But with this good Republic there come chances for everybody; chances even for *le pauvre Jacques*. Oh, I know the name you give me, Citizens and Citizenesses. You shall go your ways, and that rascal Jacques will take his way; and we shall meet at the end of it, good people, and shall see who has prospered, you or I;' and Citizen Jacques walked on, apparently unsoothed by his own reflections.

The little village of Pastal lay a league before him in the pleasant sunshine. He walked on, muttering every now and then to himself, until he reached the outskirts of the village, when every one who met him offered, in spite of his ragged garb, a swift recognition of the surly salute he flung them as he passed. If anything, cobbler, woodcutter, and grocer in Pastal were a little more subservient to Citizen Jacques than their fellows in Vieuxchâtel had been; and the ragged rascal lounged through the little street like an ill-tempered monarch, nodding right and left to abject subjects. The notary's office being reached, Citizen Jacques rudely pushed open the door and entered, like one who had a right there.

'Citizen Notary,' said he, encountering Maître Brissot within the room he entered, 'your services are required at Vieuxchâtel;' and he sat down without doffing the Phrygian cap.

'Believe me, Citizen Jacques,' returned Maître Brissot, a keen-looking, spectacled old gentleman, with a rosy complexion and plump hands, 'you are less welcome than you would make it appear to yourself. Under the rule of our good Republic, a good Citizen's house is his own, my friend.'

'I am as welcome to your house,' responded Jacques, 'as you to my name, Citizen; and half a score of years ago, when I brought good business here, I was welcomer than I should care to be again.'

'Neither you nor your business,' said the notary, 'have been welcome here, Citizen Lamballe, since you took to the wild ways that followed your poor father's death, and would have broken his heart thrice over had he lived to see them.—But who,' he added hastily, as if to prevent his unwelcome visitor from responding, 'is in need of my services at Vieuxchâtel?'

'Oh,' said Jacques, with a somewhat sinister smile, 'I am turned Christian, Maître Brissot, and am doing good to them that spitefully used me. I carry a little message for an old rival of mine. The handsome Captain marches to-morrow, and must needs be betrothed before he goes; and old Thurot must needs choose me as his messenger for a notary. You may come as soon as you will. I had promised to bring you before noon, and it is noon already.'

The old notary regarded him keenly, and made as if he would have spoken; but turned away, and busied himself in stacking together and locking up a little pile of papers. 'And now,' he said, when his preparations were completed, 'I am at your service, Citizen Lamballe.'

The ragged Citizen led the way—the notary following closely at his heels—bestowing upon the village people, as if in intentional display of his powers, the same contemptuous recognition as before. That the man of law took note of his companion's manner, was evident; but he forbore to speak of it; and the two travelled in silence for half a league, till, being in the widespread fields

again, Jacques turned upon the lawyer with his evil smile. 'They will have a happy married life, do you think, Monsieur Brissot?' he said.

'My friend Lamballe,' returned the notary, 'I am free to say that I do not like your manner. Your errand is discharged, and we may as well say "Good-day."'

Jacques laughed. 'Do you think I would harm the pretty pair?'

The notary regarded him with much distrust, and pushing past him, stepped out rapidly; but his legs were no match for those of Jacques, who, with no apparent quickening of his stride, kept easy pace with him, looking down into the notary's keen yet good-humoured face with an expression of sardonic amusement.

At last, the little man made a decisive pause. 'Take your way, Citizen Lamballe, and I will take mine.'

'What!' cried Jacques, 'not to know that our ways are the same. With what decency could I let my old sweetheart be betrothed, and not be there?'

The notary was about to make a passionate reply, but checked himself, and pursued his way in silence, the ragged Citizen holding on by his side with the old sinister look of enjoyment. The house to which the lawyer had been summoned was that of a man but one remove from the better class of tradespeople. It was a small but comfortable-looking tenement, standing back a little from the road, and its front was covered with the broad leaves of the vine, and promising clusters of half-ripened grapes. Within the porch stood Citizen Thurot, a ripe, healthy, well-to-do personage of middle age, who, disregarding the ragged messenger, strode forth to meet the notary with outstretched hand.

'Aha, Maître Brissot,' he cried cheerfully, 'you are late. Our good Camille marches to-morrow to fight against those rascally Prussians, and must needs be betrothed before he goes. We have expected you this hour back. But better late than never.'

'Why, as for my being late,' returned the notary, 'you must thank your messenger, neighbour Thurot. As soon as I heard the news, I came.' As he spoke the words, he gave a backward wave of the hand to indicate Jacques; and M. Thurot turning for the first time towards that personage, regarded him with great disfavour, and plumping round, walked straight into the house, leaving the notary to follow. The man of law had taken the vagabond's promise to be present at the ceremony as nothing worse than a tasteless jest; and he was considerably surprised when Jacques pushed in before him, and entered the house at its proprietor's heels.

'I think, Citizen Lamballe,' said the notary, 'I am likely to be right in supposing that you have not been invited here.'

'I am going to ask for my letter of invitation now,' returned the vagabond; and he looked so grim, that the little notary, who had at first some idea of opposing his progress, thought better of it, and allowed him to pass in unmolested. 'Let the people of the house deal with him,' said Maître Brissot to himself.

'Your business, my friend?' said M. Thurot, facing round on Jacques as the latter entered.

'I am here,' returned Jacques, with great cool-

ness, 'as a friend of the family! I come to witness to-day's pretty little ceremony; and I am sure you will make my father's son welcome beneath your roof.'

'Your father's son,' cried the host angrily, 'is the one man of all others who ought to be welcome here; but'—

'So I thought,' interrupted Jacques calmly.

The old man broke out: 'Leave my house, and never dare to enter it again!'

'This is the way of the world!' cried Jacques, laughing hoarsely. 'An old friend comes in a blouse, and finds himself unknown; but *sabots* are a good disguise for feet that have sported diamond buckles in their time. I came here in friendship, Citizen Thurot.' He waved his hand and turned; when a young fellow in the dress of a Captain of dragoons entered from an adjoining room and took him by the arm.

'Nay, my father,' said the newcomer. 'If Citizen Lamballe would be one of us, let him stay, for old acquaintance' sake.—And I would fain, Jacques,' he continued, swaying the vagabond gently to and fro by the arm, 'that thou wouldst come with me and fight the enemies of our good Republic. Hast good fighting stuff in thee, man! Come, tell me, what sayest thou?'

'The Republic,' said Jacques darkly, 'has need of servants at home as well as abroad, in these times, and my place is here. But since you ask it, I will stay;' and without further speech he took his seat in a corner, with a smile of triumph directed towards the notary. The shot missed its mark, however; for the old man, with a sniff of very decided meaning, busied himself among his papers, and taking his seat at the table, awaited the advent of the bride. M. Thurot, with no pleased expression of countenance, left the room, returning after a moment's pause with his daughter Marie, a pretty and gentle-looking girl, who, casting one frightened look at Jacques, took her stand by the soldier's side. Two or three of the neighbours stood about the room, and one and all, by their looks, testified surprise at the presence of that ragged figure in the corner. Jacques, however, held his head high, and gave back the looks they lent him with an insolence more than proportionate. The ceremony—leisurely as the old notary went about his business—was soon over; and at its close, Jacques Lamballe resumed his feet, and addressing the newly betrothed soldier, asked with an air of banter: 'And whose corps do you join, my Captain?'

'I join Colonel des Moulins,' responded Camille.

'I had thought it was Colonel la Mort,' returned Jacques with a sinister laugh.

The bride seized her betrothed husband by the arm, with a look of terror at these words of evil omen.

'Take no heed of the scoundrel!' cried old Thurot.

Jacques gave one twirl of the Phrygian cap. 'You are good patriots all,' he said mockingly, 'and I have the honour to bid you good-day.'

As he disappeared, the betrothal party looked at each other with uneasy glances. They were days when even a breath of suspicion might be fatal to the bravest, the best, and the fairest; and all hearts there had read a threat in the swaggering *vaurien's* tone.

CHAPTER II.

The great French Republic contrived in the course of its brief life to change a good many things; but there are matters which are happily beyond the meddling of even a great Republic. The month of Thermidor was recognisable as a French July, notwithstanding its change of name; and in spite of the amazing throes of terror that shook the whole land of France, it was noticeable that July was still acceptable as a pleasant kind of month to make love in. Even in Paris, where, during that awful time the common sewers ran blood, and La Guillotine accounted for scores of victims every day, there were the same old episodes of love with which Phyllis and Corydon were familiar in many leafy Arcadias. A wise man remarks that Nature returns again, though expelled by a pitchfork. In France, in the year 1793 of the Christian era, and the year 2 of the new reign of Liberty and Brotherhood, poor Nature was expelled by a forest of pikes, and kicked out by innumerable blood-stained *sabots*. Yet she returned again; and in the light of her presence, young hearts loved, and young hope gaily fluttered above them—quite in the old way. And if that were so even in that terrible capital and within the very sound of the dread tumbrils, you may be sure that in quiet country places, lovers could now and then find a happy breathing space in the pauses of political and social agonies.

It was not an English lane down which the lovers walked, nor had it an English lane's calm and sequestered beauty; but it had charms of its own, with which they were fully content, and more familiar. For long miles before them, the road ran straight as an arrow, and on each side rose an endless line of tall, gaunt poplars. Between the tree-trunks on one side, the lovers saw an opulent country, smiling with corn and vine; and between the tree-trunks on the other, the summits of the Alps, with eternal snows gleaming white in the sunshine.

Handsome Camille deserved the name the common tongue had given him; and Marie Thurot was more than pretty and engaging enough to justify the fond admiration her lover's glance expressed as he looked downward to the face that nestled at his side. The freedom allotted to any engaged young couple in France, was then, as now, much more circumscribed than it would be in England; but in a quiet little border village like Vieuxchâtel, it was scarcely regarded as a breach of the *convenances* to allow a newly betrothed pair who were to part within four-and-twenty hours of their betrothal, a few unrestricted moments to themselves. And so Camille and Marie were for a little while alone; and in spite of the forebodings which the girl's gentle heart could not resist, they were happier, almost, than they knew. For at such a time it is natural to lovers to think themselves unblest, though there comes a time in life when even lovers' partings are pleasant to remember; only less pleasant, perhaps, than lovers' meetings. Camille spoke of the future hopefully, like a lover, and a soldier of fortune and of the great Republic.

'Colonel des Moulins is my good friend, Marie; and so is General Lebrun. After the engagement at Spitzberg, the General shook hands with me in presence of the staff, and prophesied my rise.'

'But when shall you return, Camille?' asked Marie.

'When the enemies of the Republic are defeated,' returned the young soldier gaily.

'Not till then!' said the girl, clinging with both hands to his arm.

'Why, child,' said the soldier, 'you speak as though that were a work of ages. France will drive this horde of *canaille* before her as the wind drives dust.'

She believed him; but, maiden-like, she had her forebodings. 'But, Camille,' she began, 'people are killed in war sometimes!'

'That is not uncommon,' said Camille drily. But a moment later he burst into a merry laugh, and threw both arms around her. 'Thou art a soldier's bride, sweet child,' he said, 'and must send away thy betrothed with merrier music than a funeral-march in his ears.'

'I will try to be brave,' she answered. 'But oh! it is hard, it is hard, to part!'

'And no less for me than for thee,' said Camille. 'A stout heart, my child!' And what with her tremulous joy at his caresses, and her fears for his future, the tears filled her eyes; and Camille, with the corner of her muslin kerchief, dried them.

The sound of heavy footsteps on the firm road startled the girl from the young soldier's embrace; and Camille, turning, beheld three figures in sabots, blouses, and caps of liberty, marching rapidly towards them. He drew Marie's arm through his own and walked on, suspecting and fearing nothing.

'Halte là!' shouted the hoarse voice of Jacques Lamballe.

The soldier's blood tingled for a second or two at the fellow's insolence; but still, suspecting nothing, and fearing nothing, he walked slowly on, with Marie's arm through his.

'In the name of the Republic, halt!' cried the harsh voice behind; and at this the soldier turned haughtily, and faced the rough trio who followed. Jacques, who was in advance, came on with a smile, in which perhaps an observant physiognomist might have found a touch of shame and compunction, and a good deal of that swaggering insolence which in half-brutalised natures is often employed to beat shame and compunction down.

'What would you with me, Jacques Lamballe?' demanded Camille.

'Citizen Camille Piquet, late Captain in the service of the Republic'—began Jacques, reading from an official paper which he carried in his hand.

'Late Captain! Insolent!' broke in the soldier.

'You are denounced,' Jacques went on, his ugly smile a little broader than before, 'as a traitor to the Republic, and a correspondent with the English Pitt; and are summoned now to appear before the Committee of Public Safety at the Hôtel de Ville of Vieuxchâtel. Surrender your sword.'

The soldier looked slowly from one captor to another. His hand was on his sword-hilt, and his heart was full of sudden desperation. But in the tricolor sash each man wore, there hung a brace of pistols, and each carried a carbine in his hands. He recognised at once the impossibility and the impolicy of resistance. He undid the buckle of his sword-belt with lingering fingers,

eying Jacques sternly the while. The messenger of the great Republic would fain have swaggered through with his task; but before that terrible gaze the insolent smile which creased his features died, and his eyes sought the ground. Marie was clinging to her sweetheart with tears and cries.

'Tush, tush, child!' he said gently, but without turning. 'This folly will be over in an hour. The Republic knows its friends.' He stretched out his right hand with the sword depending loosely from its belt, and stood, awaiting the command of his captors. Jacques seized the sword.

'Pierre—to the prisoner's left. Jean—to the rear. March!' he cried. And, with heavy clump of *sabots*, the three marched with their prisoner along the firm summer road towards the village; and Marie, with trembling feet that scarcely obeyed her will, followed them.

### SOME QUEER DISHES.

BY DR ARTHUR STRADLING.

#### PART II.

THE insect world does not yield mankind much in the shape of provender. Locusts, often as thick as one's finger and from two to three inches long, are brayed into a mash with cold water, and eaten with olives in Syria and other parts of the East, in return for the depredations which they commit. John the Baptist lived for a time on locusts and wild honey; and locusts are still used as food in Palestine to this day, the Mosaic law (Lev. xi.) classifying them as clean and lawful to be eaten. In the Weald of Kent, children eat a certain caterpillar when they spy one in the hedges, calling them 'raspberry jams;' they seem to occur in the autumn, or I suppose feed on some particular leaf at that period of the year. The *bonne bouche* is said to exactly resemble the conserve from which they derive their vernacular name, but I never tried one.

Would you eat a reptile? You shudder at the very thought. But what about turtle-soup? This is the only culinary form in which we are familiar with the reptile in England; but on the coast of the Spanish Main, where they are very abundant, and sometimes weigh six or eight hundred pounds apiece, they constitute a standard article of diet with all classes, and turtle-fin, turtle-steak, cutlets of turtle, turtle-pie, stewed, boiled, curried and devilled turtle are found in every house. The choicest Antigua turtle—reputed the best—may be purchased alive and in sound condition at the rate of about three-halfpence per pound-weight—spearer ones, which will not live long, for less. In San Juan del Norte, on the coast of Nicaragua, I once had nothing but turtle for four days, and grew to weary of it, long before the time had expired. Sometimes one buys a beautiful fat 'fish,' sound and heavy, which defrauds its purchaser presently by laying fifty or sixty eggs and reducing its weight by about two-thirds. These turtle-eggs are separate and about the size of a hen's, but the shell is soft and membranous and they are nearly globular in shape; the contents, very rich and delicious when boiled or roasted, do not coagulate by heat. I have tasted alligators' eggs, too, but there is a nauseous musky

odour and flavour about them, as there is with the flesh of the reptile itself. Iguanas' eggs are better, but much smaller. Singular to say, the eggs of the ostrich are not at all bad eating, not coarser or stronger to the palate than an ordinary duck's egg.

Next to turtle, perhaps the frog is the best-known edible reptile in Europe. France is, of course, popularly supposed to be *par excellence* the land of frog-eaters, but I doubt it very much. I have tried often in many of the seaport towns to get hold of them, but in vain; and I know that in Paris a dish of dressed frogs is as difficult to obtain, and as expensive as the rarest viands from foreign countries. They may, however, be bought in the fish-market by St Sulpice, and are occasionally exposed for sale in the market of the Faubourg St-Germain. There are many other edible frogs besides the somewhat arbitrarily named *Rana esculenta*. Many a good feed have I had off the hind-quarters—as big as chicken-legs—of the huge striped Dominica frog; and in the Zoological Gardens may be seen some large frogs, not yet identified, which I brought home the other day from Buenos Ayres, having rescued them from the spit in the open market-place. The true iguana or tuberculated lizard—scientifically *Iguana tuberculata*—is the most savoury of its order, and the best adapted for the table, especially if curried or fricasséed. It is a brilliant green creature, ranging from three to five feet in length inclusive of its whip-like tail. It is incredibly swift in running and climbing, and feeds on fruit and vegetables.

There is another edible lizard (*Teius teguixin*) of a dark-brown or black colour mottled with gray and yellow, and living on insects, eggs and small animals, which is also sometimes called iguana in common parlance.

The flesh of the iguana is very delicate, though I scarcely thought so the first time I ate it. It happened in this wise. The ship in which I was stationed was lying for some days at Carthagena, where I was introduced to a man who had just acquired one of the small but exquisitely beautiful islands with which the lagoon is filled; he had found a spring of fresh water there, and had just commenced to clear the jungle with which it was covered. Knowing my mania for reptiles, he offered to send me down in a canoe and give me a long day's snake-hunting there—an offer which I eagerly accepted, and was ready at dawn next morning with my net, bag, and other paraphernalia. But the day wore on without any sign of the canoe, and when it at length arrived late in the afternoon there was barely time to reach the island before nightfall, and the Indians to whom I was intrusted declared they must return to the city the same evening. However, I was determined not to be done out of my trip, so, hearing that such shelter as four upright bamboos supporting a mat of dried palm-leaves could afford already existed there, I added a blanket and something in a small bottle to my equipment, and arranged that my dusky boatmen should leave me on the island all night and return for me the next afternoon. With this understanding they paddled me down, and then bade me 'Adios.'

I didn't find it at all lonely that night—far from it. I believe every winged and creeping abomination that earth produces visited me in those hours of darkness, and had some of me. When I

got up next morning—that is, if the blistered, bloodless residue that emerged from the blanket was sufficient to be dignified with the first personal pronoun—the thought flashed across me that I had missed my dinner the night before, and had no prospect of breakfast where I stood. I was undeniably hungry, but comforting myself with the reflection that I could avenge my appetite on board the ship that evening, I started in quest of snakes, and so passed a fearfully hot but far from unpleasant or unprofitable day. But when night began to settle down again, and no boat was to be seen, I commenced to realise my position. I had now been nearly thirty-six hours without food, and having undergone considerable fatigue, was beginning to experience sundry evidences of my head and stomach ‘failing to connect,’ as Yankees say, and that my legs were setting up an independent volition of their own. My friend had established a colony of turkeys and fowls on his island, but though I kept on calling ‘Cup, cup, cup!’ in the most approved manner, I couldn’t catch one. There was abundance of game, too, but I had no gun; and my search for victuals in all directions round the clearing was rewarded only by the discovery of an earthen pipkin full of some native liqueur—a sort of coarse anisado. Of this I drank a quantity before lying down, and thanks to this and a wood-fire which I kindled, was enabled to pass my second night in comparative tranquillity.

By morning, all my hunger had vanished, but I felt that something graver was taking its place; so I set about in serious earnest to consider what I should eat. It was almost my first voyage to the tropics, and I knew nothing of the nature of the vegetation around me—how to discriminate between poisonous and innocuous roots, fruits, and berries. I tried to trap some crabs, but without success; and my snakes were so small that—Stay! I had noosed two fine iguanas the day before, and had tied them with a running loop to one of the bamboo poles. They had taken refuge on the palm thatch, but to pull them down was the work of a moment, though I got a nasty cut across the cheek from the sharp rigid tail of one of them in doing so. I chopped its head off, skinned it, cleaned it, ‘broiled’ it—that is, held it over my fire till it got smoked and suintty—and ate it; but even under those circumstances it wasn’t nice. What the palate did not approve of, however, the inner man did; and I felt so much better after my meal, that I not only killed and ate the other, but noosed three more into the bargain, which I served in the same way—for the whole of that day and a great part of another passed away before relief arrived.

I was lying down in the afternoon, thinking solemnly of Robinson Crusoe and wondering why he did not eat his goat, when I heard a canoe ground on the beach, and rushing out met my friend, the owner of the now detested isle, and his peccant Indians, who had been drunk and had forgotten all about me, jumping ashore. I went back that night, of course, and before I left, the Indians made a *sancocho* for me—a favourite dish of theirs, consisting of turkey, fowl, jerked beef, yam, plantain, and green maize—pronounced ‘mice’—boiled together in a big pot and eaten with *tortillas*, thin crisp cakes of manioc flour, spread and baked on a flat stone—

the most delightful repast I ever enjoyed, as may be readily imagined.

Perhaps the last thing in the world that most people would choose for a meal is a snake; nevertheless, they are eaten in some parts of the world. The Kaffir and Hottentot devour pythons and even puff-adders and other poisonous species, while the Bushman goes still further, not only eating the snakes themselves, but the flesh of animals which his arrows tipped with the serpents’ venom have brought down. Sir T. Mitchell tells us that the Australian natives are also snake-eaters; and M. Palizot-Beauvois relates that in Kaskaskia—a town on the banks of the Mississippi—he was invited to partake of ‘Musical Jack,’ which proved on investigation to be fried rattlesnakes, decapitated and skinned, and showing a meat as firm and white as chicken. ‘Musical Jack’ was a standard dish in that snake-infested region. Even the Spaniards during their occupation of Louisiana grew accustomed to consider this most venomous reptile a welcome adjunct to their diet, and it is said that the officers in garrison at Fort Adam used to give large sums for the fattest and biggest rattlesnakes which the soldiers caught. In certain districts of France and the Black Forest, a *tisane* or broth of vipers is still held to be a specific for gout and scrofulous affections; and the famous physician, Dr Meade, writing in 1743, recommends powder of dried vipers, viper lozenges, viper-broth and jelly, the flesh of boiled vipers, and ‘viperine salt’ dissolved in wine, for lepra and other cutaneous eruptions. I have eaten the big French viper—*Vipera aspis*, a different species from our own British adder, which, however, exists plentifully on the continent under the name of the ‘little viper’—and Anaconda as well, but remember nothing very distinctive about either.

In this Age of Tin we need not go far afield in search of strange food; all manner of outlandish things are now preserved and sent home to our own doors. The grocer can now supply us with Australian beef and mutton; and kangaroo soup and other foreign delicacies lie on his shelves side by side with Paysandu ox-tongues and Liebig’s Extract from Fraybentos.

I see that tinned pepper-pot is now to be obtained in London, but cannot fancy that it would be much like the real article. Pepper-pot is a favourite relish for breakfast out West, and is eaten with rice like curry; in some of the old families in Demerara it is made to perfection. An iron crock is filled up daily with scraps of meat, fish, almost anything, and various spices, peppers, chillies and other condiments added, the essential one being *casaripe*, a thick, black, treacly fluid extracted from the cassava root. The crock itself is brought to the breakfast-table, and the contents served with a wooden spoon; the mixture is black and fibrous in appearance and intensely hot to the palate, but the *sine quâ non* of excellence in a pepper-pot is that it shall never be allowed to become empty. The quantity it holds is immensely disproportionate to that required for daily consumption—nevertheless, it is filled up every morning, and kept perpetually simmering.

The other day a steamer brought to Bordeaux some joints of antelope, giraffe, hippopotamus and porcupine preserved in ice from the coast of Africa,

destined for a banquet given by an eccentric millionaire in the capital; and Herr Hugo von Koppensfels, the African explorer, now on travel, writes to say that in the rivers about the Gaboon the manatee is hunted for the sake of its flesh to such an extent that before long it will probably become extinct.

But are there no products of sea or land at home which are excluded without reason from our list of food supplies? Certain seaweeds yield a wholesome and nutritious jelly; many fish and molluscs are pronounced uneatable which contain nothing injurious to health, or offensive to the eye or palate; and it is possible that our woods and meadows might afford many herbs and roots capable of being cooked into something more attractive than the mess of boiled watercress and cucumber which cottagers eat in Somersetshire. An infusion of the young leaves of the sloe-bush dried, well known as an adulteration of tea, is by no means a bad substitute for that beverage. With regard to the representatives of our fauna of which I can speak from exceptional gastronomic experience, I may say that I found sea-gull and otter very bitter and fishy; mole and mouse slightly disagreeable, but almost tasteless; squirrel and rat fairly good, and hedgehog remarkably so.

Gipsies are the people for hedgehogs. They have dogs trained for the purpose of catching them, and start on their expeditions at dusk, returning at daybreak with their prickly spoil, after a tramp of many miles perhaps, through the country-side. No doubt the dogs are scientifically trained, and there may be other things besides hedgehogs, in the bag, when it reaches the encampment on the common in the morning. The first I ever tasted I saw cooked outside a gipsy tent, where I squatted on the grass and watched the whole operation. It was killed by a blow on the head; not cut at all, but unrolled and wrapped in a mass of clay, and deposited in a little pit full of hot ashes. Then the fire was piled on the top of this, and in about half-an-hour the roast was announced to be ready. Piggy was disinterred from the ashes and his earthen envelope, now baked hard, broken open; to this the skin adhered, while the 'inside' came out in one lump when a suitable incision was made. My first impressions were certainly favourable, but they were more than confirmed afterwards, when a kind-hearted farmer's wife, hearing of my predilection, dressed several hedgehogs for my special behoof in different ways. We unanimously decided that it was best jugged after the manner of a hare, and it has a really characteristic gamey flavour about it.

One observes that most of the out-of-the-way things that have been eaten are recorded by the experimenter as 'greatly resembling chicken in flavour,' or veal—which is somewhat tantamount to saying they have no flavour at all; but in point of fact it is difficult to draw the line honestly between two extremes. When a man has mustered courage enough to eat an unfamiliar article, he does not like to confess afterwards that it was anything but good; but according to my experience, one rarely has the opportunity of a fair test, because one has almost invariably to cook for one's self. No one else, servants included, will touch the things. Rats, for instance, I firmly believe, would be not only wholesome, but very

nice if properly prepared—not common sewer rats, but such as I ate, barn-fed animals snared in a hop-garden. The flesh, though perfectly white, was dry and tasteless; but then they were only skinned, cleaned, and submitted to the fire without any of the etceteras which make other meats savoury. Dr Kane, Rear-Admiral Beaufort, Captain Inglesfield, and other arctic explorers speak highly of rats as a welcome addition to their supply of food in those dreary latitudes.

### LEGENDS OF THE ENGLISH LAKES.

IN addition to the beauties of the scenery, the Lake District possesses an especial interest in the numerous tales and legends associated with almost every height and *how*, every lake and *ghyll*. The very names given to them recall to our minds the times of our Scandinavian forefathers. For instance, Silver How at Grasmere is the Hill of Sölvar, and Butterliphew is the Mound of Butliar, surnamed Lepr the Nimble. Windermere, Buttermere, and Elterwater are the meres and water called after the ancient Norsemen Windar, Butliar or Butar, and Eldir.

The belief that these hardy sea-kings selected the mountain-tops for their burial-places, suggests the theme of many a poetic legend; and the fancy still exists that they revisit the place of their sepulture, and make their presence known by musical tones, as of unearthly harps touched by no mortal hands. One of these legends, called 'Sölvar How,' tells how the beautiful 'Dagmar the Dane' on her white steed was allured:

With the firstlings and yearlings, from hill-top and hollow,  
Gathering far, the sweet voice of the Phantom to follow—  
To them sweeter than murmur of fountain and rill.

The Princess was favoured with a vision of the Phantom 'in all his bright beauty;' and when he left the hill-top which overlooks the placid lake of Grasmere, she followed him—

To hear his wild songs all alone;  
And to chase from his lips every accent of sorrow,  
As they walked through the dawn of a brighter to-morrow  
Into sunlight that heaven upon earth never beamed.

Deaf to her hapless father's entreaties that she would return to his tower at Skelwith, she fled over hollow and hill till they reached the deep chasm of Dungeon Ghyll. Softly the shade glided over; and though some huge rocks falling with a crash, bridged over the gulf, the maiden in vain stretched out an imploring hand. The shade was gone. And

In her bower and in hall there was wailing and sorrow,  
And the hills shone renewed with each glorious to-morrow,  
But their bright star, their Dagmar, they knew not again.

Equally pathetic is the story of Ermengarde, connected with St Herbert's Isle, on Derwentwater. She had made some tapestry for the altar of St Herbert's Chapel, and rose on Mayday with her love divided between God and the saint. An Elfman

who was passing Ermengarde's window told her she might have her Mayday wish fulfilled if she would ask the two fishes of Bowscale Tarn for 'two tiny scales, of gold and pearly whiteness,' and place them on her heart. But alas! when she placed them in her bosom, the link which secured round her neck the 'simple cross' her mother had given her, was broken. Her thoughts too fondly set on the 'bright angelic air' of the saint, she wandered down Greta's side, and staying for a moment's glance at herself, 'before she looked on him'—

Its broken link dissevering,  
Her little cross fell sinking low  
Beyond her vain endeavouring.

And then having her in their power,

From the stream two fin-like arms  
Leapt up and snatched her wailing,  
And dragged her down with all her charms  
In anguish unavailing.

The story runs that the misguided maiden is not wholly lost, but waits till

Some bard shall wander by  
With harp and song so holy,  
That they shall wrench the caves where lie  
Her limbs in anguish lowly.

Bowscale Tarn is a little north-east of Blencathra, now called Saddleback. It has long been a tradition in that country-side that it contains two immortal fish. Lord Clifford, 'the Shepherd Lord,' is said to have held intercourse with them, and had authority over them. Readers of the classics will recollect that Martial mentions some fishes in a lake at Paice, in Campania, which were consecrated to Domitian, and knew their master.

Bede, in his *History of the Church of England*, gives a beautiful description of the friendship between St Herbert and St Cuthbert of Farn Isle. When St Cuthbert was near his end, his 'brother Herbert' implored him to pray that they might 'depart hence into heaven together.' And the prayer was granted. In death, they 'were not divided'—on the same day their souls departed from their bodies, and were straight in union in beatific sight and vision.' This was in 687 A.D.; and as late as 1374 we find that the hermit's little oratory or chapel was resorted to in memory of his death, with services and processions. Forty days' indulgence was granted to all those who were present at the mass celebrated by the Vicar of Crosthwaite on the anniversary day.

The story of 'The Cuckoo in Borrowdale' is of a more laughable kind, and a fair specimen of the tales told about those good folks; of whom Mr James Payn says, 'they are the very simplest in the world, their language the broadest, and their notions the narrowest.' Living in their dreary valleys, the Spring was a great joy to the simple dalesmen, and the voice of its harbinger a most welcome sound.

"'Tis the cuckoo!" In the hollow  
Up the valley seemed to follow  
Spring's fair footsteps that sweet throat,  
All the fields put off their sadness;  
Trees and hills and skies with gladness  
Answering to the cuckoo's note.

It occurred to the natives, that if they built a wall across the entrance to the valley, they might keep the cuckoo within its bounds, and so insure perpetual spring. But, sad to say, when June came and passed, with it passed away the 'indefatigable' bird—

While in stupor and amazement,  
Vacantly, from cope to basement,  
Glowering at their wall, they stood.

The ingenious plan had failed, 'but 'only because, according to popular belief, from generation to generation, the wall was not built one course higher.' After this, we are not surprised to find that 'the inhabitants of Borrowdale were a proverb, even among their unpolished neighbours, for ignorance.' A similar story is also told of the foolish community known as 'the wise men of Gotham.' Many more or less improbable stories are told of their simplicity, such as mistaking a red-deer for a horned horse, and a mule for a peacock!

'The Tale of the Stirrups,' says Mr J. P. White, in his *Lays and Legends of the English Lake Country*, 'is perhaps a little too absurd even for Borrowdale. A "statesman" brought home from a distant fair or sale what had never before been seen in the dale—a pair of stirrups. Riding home in them, when he reached his own door his feet had become so fastened in them that they could not be got out; so, as there was no help for it, he patiently sat his horse in the pasture for a day or two, his family bringing him food. Then it was proposed to bring them both into the stable, which was done, his family bringing him food as before. At length, it occurred to some one that he might be lifted with the saddle from the horse, and carried thereupon into the house. There the mounted man sat spinning wool in a corner of the kitchen till the return of one of his sons from St Bees' School, whose learning, after due consideration of the case, suggested that the good man should draw his feet out of his shoes; when, to the joy of his family, he was restored to his occupation and to liberty.'

Those who care to study the dialect of Cumberland and Westmoreland will find instruction and amusement combined in Mr Richardson's *Cumberland Talk*, in Dr Alexander Craig Gibson's *Local Dialects of Grayson, &c.*, and in Mr Dickenson's *Cumbria*. The following anecdote from a paper of Dr Gibson's on the 'Ethnology of the Lakes' will serve as a specimen of the dialect: 'I was walking up the pleasant little village of Branthwaite, and came upon an old-lady villager pottering over something or other in the gutter near her house. Wishing to propitiate her, I remarked that there had been a good deal of rain in the night, for the river was swollen. "We co' it a beek," said she very snappishly; and turning her back upon me, called out to her grand-daughter "to bring out t' scapple." And I, with some deference of tone, asked simply, "What may a scapple be?" when the girl came out with a small coal-rake, to which the old dame pointed, saying, "Whè, that's what a scapple may be!" And as I moved away rather sheepishly, I heard her call across the road to a neighbour: "I don't know whar t' doctor's been browte up—ho co's t' beek a river, an' doesn't know what a scapple is."

In conclusion, we would commend to our readers' perusal Mr White's *Lays and Legends of the English*

*Lake Country*, from the poetical portion of which we have given several quotations above; and Mr James Payn's *Lakes in Sunshina*, one of the most charming works on Lakeland ever written.

#### BENJAMIN FRANKLIN ON THE USE OF OIL AT SEA.

Dr Benjamin Franklin was a believer in what has been frequently pointed out in this *Journal*, namely, the power of oil to still the agitation of water, and he records several experiments as the ground of his belief. In a letter to Dr Brownrigg in 1773, he mentions that in 1757 he observed the wakes of two ships to be remarkably smooth, while the wakes of all the others were ruffled by the wind, which blew fresh. The captain of Franklin's ship explained this by supposing that the cooks of the two ships had been emptying their greasy water through the scuppers. He was informed by fellow-passengers that the Bermudians when they would strike fish, the Lisbon fishermen when the surf was high on the bar, and Mediterranean divers when the ruffling of the water cut off their light below, were accustomed to use oil to procure a still surface. These instances, however, were hearsay.

The philosopher himself tested the power of oil to smooth water on the pond on Clapham Common, where a teaspoonful of oil, poured on the windward side, produced an instant calm over a space several yards square, and spread until it reached the lee side, 'making all that quarter of the pond, perhaps half an acre, as smooth as a looking-glass.' He states that he repeated the experiment in the country as opportunity offered, and found it constantly to succeed. Two other corroborative hearsay illustrations are mentioned by Franklin. One was, that Sir John Pringle learned in Scotland that herring-fishers could see at a distance where shoals of herring were by the smoothness of the water over them; the supposition being that some oiliness proceeded from the bodies of the herrings. The other story was that the harbour of Newport, Rhode Island, was observed to be always smooth while any whaling-vessels were in it. Franklin goes on to say that he showed his experiment to Count Bentinck of Holland, his son Captain Bentinck, and Professor Allemand, on 'a large piece of water at the head of the Green Park;' and that the Count said he had received a letter from Batavia relative to the saving of a Dutch ship in a storm by pouring oil into the sea. Subsequently, Franklin, with Captain Bentinck and some friends, tested the efficacy of oil on the surf at Portsmouth, by pouring some oil into the sea half a mile from the shore, on a windy day. The experiment was but partially successful, since no material difference was observed in the height or force of the surf upon the shore; but there was a long tract of smoothed, not level water; 'and a wherry, on her way to Portsmouth, seemed to turn into that tract of choice, and to use it from end to end, as a piece of turnpike road.' Franklin accounted for the want of complete success in this instance, by conjecturing that the mechanical force of the waves already raised by the wind must go on until exhausted, as a pendulum continues to swing after the original impulse has been withdrawn. He held, however, that the oil diminished the action of the wind on the waves already raised,

and that it prevented the wind from raising new waves. He seems to accept Pliny's statement, that the seamen of his time stilled the waves by pouring oil into the sea; and he adds: 'It has been of late too much the mode to slight the learning of the ancients. The learned, too, are apt to slight too much the knowledge of the vulgar. The cooling by evaporation was long an instance of the latter. This art of smoothing the waves by oil is an instance of both.'

#### DAY-DREAMS.

WHERE o'er the network of the trees  
A fleecy cloud slow drifts o'er drowsy skies;  
Where love-lorn sighs the languid breeze,  
And drooping dyes in minor melodies,  
Among grass-hidden violets and thyme,  
I weary listless lie, low murmur'ing some old rhyme.

Soft languors through the pulses creep,  
Whilst idle dreams flit in dim purple shade;  
E'en love-sick Pan lies stretched asleep  
This noon, methinks, in cool Arcadian glade:  
Silent are shepherds' pipes on hill and vale,  
Silent the river slowly winds adown the dale.

What is 't darts down the startled air,  
Flashing with gold and gems of lustrous light?  
Excalibur, sword strong and fair,  
'Tis surely whirling swift through moonlit night—  
That last weird night of Arthur. Nay! a ray  
Pierces a deep dim nook hid far from the garish day.

But soft! The mad Ophelia sings,  
With straws and flowers all tangled in her hair—  
How sad, yet sweet, that strain upsprings  
And wings its way upon the list'ning air—  
'Will he not come again?' Away, away!  
A distant wood-dove 'tis, cooing on leafy spray.

Yet heard you not the tearful tone  
Of 'Willow, willow,' 'neath you drooping tree,  
Where Desdemona sits alone,  
Her weary head low bowed o'er her knee?  
Ah, no! 'Tis but a few faint notes a bird  
Pipes feebly forth, as if by some sweet memory  
stirred.

Now o'er the quaint old German street  
The loitering shadows scarcely seem to steal,  
And merry sings meek Margaret,  
At work beside her whirling spinning-wheel,  
A ballad of the King of Thule gay—  
Thou dreamer! 'tis a stream that babbles on its way.

Away! thou sweet delusive dream,  
That faintly flits before the half-shut eye,  
Where, mingling with the flowers, there gleam  
Strange elf-like forms begot of Phantasy.  
Pans-blossom, Puck, ye tuneful fairy bowers!  
Life's flower is too short-lived to waste with you the  
hours.

Yet stay! that ye—like silver light  
Trembling amid the shimmering summer rain—  
To quivering lips and sad eyes bright  
With brimming unshed tears of silent pain,  
A distant glimpse of sunshine still may bring,  
Which, cheering weary wayworn hearts, may bid  
them sing.

## WAXWORK HUMANITY.

It has frequently been our good fortune to visit waxwork exhibitions, and review a bewildering multitude of courtly, heroic, peculiarly wicked, or otherwise 'distinguished' public characters. Their halls of reception are constantly visited from morning till night by an appreciative stream of all classes of visitors. What, we have often inquired of ourself, is the fascination of waxworks, and what draws the public after these waxen kings and murderers, whether in Madame Tussaud's of Baker Street celebrity, or in the large exhibitions at provincial towns, or in travelling shows like the celebrated 'Mrs Jarley's,' that carry waxwork curiosities to village, and market, and fair?

The reasons for interest in wax figures are somewhat complex. Popular interest fastens upon them, not merely because they are likenesses of celebrities; for a gallery of merely historical portraits, a photograph album full of famous faces, would not be a bait to attract one shilling out of every hundred that are paid for seeing the waxworks. Again, the people do not go simply to see the costumes, although those at Madame Tussaud's are gorgeous and costly, and—what is more to the purpose—in many cases interesting for correctness of detail. Nor is it as statues that the figures are sought; the mass of the English-speaking nations are sadly unappreciative of really noble sculpture; statuary has little attraction for them, though art on canvas has; and to statues of famous men they give but very indifferent glances—possibly because most statues of famous men are but indifferent productions, unintentional libels in sooty bronze or unmanageable colossal stone.

Something of all the foregoing reasons may enter into the complex fascination that we are trying to analyse; but we believe the grand attraction is that, at a waxwork exhibition, celebrities are represented in what is supposed to be a life-like manner, and visitors who see them in the wax have an advantage over those who see them in

the flesh; for they can examine them and stare at them at close quarters as long as they like—a popular luxury never possible among the conveniences of real life. One can sit down comfortably directly in front of the highest Lady in the land, her splendid court and charming grandchildren, and examine their features without being sent to the Tower, or even without being turned out as a graceless, hopeless, impertinent clown. One can fearlessly criticise the crowned kings of England. One can walk up boldly to any Public Man, and stand at his elbow without being button-holed and compelled to listen to his own particular hobby. One can pass remarks on the conduct of our Generals, face to face with them, without knowing any more about military matters than a Whitechapel Arab; and one can spend five minutes with the Sultan of Turkey and a couple of Pachas, staring at them, with a blissful freedom from ceremony and the Eastern Question. More than all—one can enter securely into a lair of thieves and murderers, and feel with a chill that they are shockingly like commonplace mortals; nor is there the least danger of their overhearing free remarks, or stooping from the front of the crowded dock close overhead, to take the reckless vengeance of despair, the moment one turns to walk away. We infer from all this that it is the belief in the similitude of the figures to life, the freedom with which we may examine the faces, and the safety of criticism, that constitute the main attraction of a waxwork show.

We have alluded to 'the belief in the similitude of the figures to life,' because it is an open question how like or unlike they are, not only to the persons whose names they bear, but to any flesh-and-blood humanity. Probably the best waxwork exhibition that ever was, is the well-known Madame Tussaud's; and yet nine out of every ten of the 'distinguished characters' are as palpably dead wax as an empty honeycomb. Madame Tussaud herself was, in drawing and modelling, a pupil of a certain M. Curtius, her own uncle, an artist employed by Louis XVI.; and she herself gave instructions to the sadly

famous Madame Elizabeth. This connection accounts for the prominence of the model of the Guillotine, of Marat dead, and of the various beheaded Revolutionists. The collection of Napoleonic relics betokens the sympathy of the old lady and her successors with the Conqueror, whose first step had at least the advantage of restoring order. The sleeping and breathing figure of the youthful Madame St Amaranthe, the royal French groups of this period, and most notably the figure of Voltaire, are this wonderful old lady's own handiwork; therefore we must suppose them to be the most satisfactory and painstaking work ever done in wax; and yet they are in many points far from perfection. After the Reign of Terror, which she had witnessed, Madame Tussaud left France, and exhibited her collection as a travelling show on English ground. At last, she settled down in London, where her successors have multiplied the 'distinguished characters' as fast as occasion called for them; but some still living can remember youthful visits to the show, when the shrewd, clever, and really talented old lady herself received the shillings at the door. Yet with all the care that is taken in producing the wax figures of the best exhibition, to our mind they are but sorry imitations of the reality.

In only two instances, so far as we remember, is there an approach to an appearance of flesh. One of these is a Statesman who is credited with Cromwell's absence of portrait-vanity, and given a rough blotchy cheek—a singular thing in wax, though common enough in nature, and therefore more likely to suggest nature than waxwork. The other is that venturesome explorer who found Livingstone, and who, in the act of finding him, is presented to the public with a quantity of dust upon his face, betokening African sands and scarcity of water. It is the dusty complexion in the one case and the blotch and pimple in the other, that counteract the waxy effect.

Even the highest artists confess that one of their most difficult tasks is the true representation of the tints, and of what is called—somewhat erroneously—in art language, the *texture* of flesh. To imitate the substance and colour of flesh, is the object of all modelling in wax; but the art has made but little progress, perhaps because the difficulty is not recognised. A finely painted portrait by a true artist is more like living humanity in the apparent substance of flesh, in colour, life, and expression, than anything that has ever been made and shaped and set up standing like a human being, in wax. But the artist despises as a mere trick any method of making his work appear deceptive. Uneducated taste is pleased at its own delusion, like a child with a conjurer; and a hand or head 'raised out from the picture' is the highest triumph it knows—until it goes to the waxworks, and there the hand and head of the portrait can be looked at on all sides; and uncritical eyes confound the living and the waxen, and the pleasure of delusion is complete.

We must confess that on entering an exhibition-room full of human-like faces, ranged all round with living people moving about and staring at them to their hearts' content, a peculiar feeling is engendered for the moment, as the music strikes up to a gorgeously dressed assembly that don't

stir. Under these circumstances, a policeman midway towards the door is a six-foot deceiver; and the only way we can account for the success of waxen policemen is partly because the human mind is impressed with the 'divinity that doth hedge' a member of the Force, and partly because it is impossible to grasp the idea that such an extent of uniform contains padding and props, and nothing else. Again, though in another way, in this nervous state consequent on one's sudden introduction to the court circles, it is possible to be deceived by an old gentleman sitting on one of the seats, with black clothes on, and a broad-brimmed hat. The sensation is 'uncanny' when he turns his head slowly round, with fixed eyes, and the feeblest expression, as if complaining. 'I'm very ill—very; and I can't get off the bench! And what is it—all—about?' Upon which, finding that this is Cobbett, we wonder, with a shudder, what that ill-fated man ever did, that while he sleeps peacefully in his grave, posterity should prop him up with his head veering like a weathercock. When Charles Dickens visited this exhibition, he noted what we may call the peculiar manners of waxwork figures—that they appear to be talking except where they are meant to be conversing, and there the silence is oppressive; that instead of walking, they skate about, leaning with one foot forward, till their balance is marvellous; that no matter where one stands, or how one tries, it is impossible to catch the eye of a waxwork.

Continuing our review of the Baker Street exhibition, our own strongest impression from the Hall of Kings has always been the extraordinary family likeness among all the Normans and Plantagenets. Ruddy complexion, brown hair hanging at each side, sandy moustache, large eyes wide apart, gold crown on top, are the kingly characteristics handed on from sire to son, in a beautiful and touching manner, through the whole line. When we turn to the Tudors, the six wives of Henry VIII. presented to the burly monarch all at once, without disturbing his composure, or without spoiling the amiability of any of the half-dozen—except Anne Boleyn, who is deserting the group in disdain, and—dressed in a black hat, black student's gown, and yellow pinafore!—is making for the corner held by William of Wykeham. It is an example of the wonders of waxwork society, and the sublime indifference of all concerned as to time and associations, that instead of leaving the six ladies alone to manage their lord, Edward III. edges his way in from a corner at the back, dragging his beautiful Philippa with him on his arm, to add to the general embarrassment. But the ways of waxwork society are wonderful.

Wonderful, too, are the ways of visitors! On a hot day, when the whole establishment is pervaded by a peculiar deathly odour of warm wax and old clothes, it is wonderful how visitors—chiefly from the country too—find an appetite for the buns and tea, pies and effervescent, displayed at a *buffet* between the wax-smelling court circles and the Chamber of Horrors. What of that black-hung chamber dimly lighted with gas, and full of images of unhappy men and women who outraged God, man, and their own nature, and were cut off by human justice in unspeakable degradation and ruin? What of the hideous casts lining the walls, faces of the dead with the last look

of calm or contortion that came with the death-pang? What of plaster-cast heads, with exposed necks, where the curious may examine the deep dragged mark of the rope? What of the Chamber of Horrors—not alone in this exhibition, supposed to be very rich in horrors, but in any other show? Only this—that we cannot conceive such an institution existing as an adjunct to what is otherwise entertaining and instructive, for any other reason, than because it panders to a morbid, unhealthy, unfeeling curiosity—the same callous curiosity that, on a larger scale, and acting on lower minds, drew in former years a clamorous, unruly, degrading and degraded crowd about the public gallows. The visitors to the Chamber are happily mostly of a thoughtless, indifferent class of sightseers. Any one who visits such sights, thoroughly alive in sense and thought, and interested in every object, must almost certainly be either veritably horrified or self-ashamed.

Come out of the Chamber of Horrors, quick! Take a good look at that living baby in its nurse's arms, and catch a smile of her sparkling eyes. Presto—pass! We are in the healthful, hopeful, innocent world again.

## JACQUES.

AN EPISODE OF '93.

BY DAVID CHRISTIE MURRAY.

### CHAPTER III.

THE members of the Committee of Public Safety, hastily summoned from their several avocations, sat at the Hôtel de Ville. One, a patriotic tanner, filling the hall with the odour of his tan-pits, sat in his shirt sleeves. Another, a butcher, bearing marks of his recent occupation, wore huge boots of greased leather to his thighs, and had a great knife stuck in his leathern girdle. All of them, to the number of eight, were men who lived by the sweat of the brow; all were ignorant and obtuse; and every one amongst them was ripe for any mad suspicion which might assail any man within the limits of France, however noble his record, or however lofty his character. Even to Camille, their faces had a grim and unhopeful look. He assumed the place assigned him, and bowed his head to the rough tribunal, as one who recognised their authority, but was yet conscious of his own innocence. The place was crammed; for, to reach the building, Camille and his captors had marched the whole length of the village street; and everywhere the sight of the familiar Captain of dragoons in custody had excited wild surmises; and from every house he passed in custody, the whole inhabitants—men, women, and children—poured and followed.

'I am under accusation, Citizen Gaudet?' asked the young soldier, addressing the head of the tribunal. 'Who are my accusers? and what is the charge?'

'The charge against you,' returned the President, 'is, that you have held treasonous correspondence against the interests of the Republic with the emissaries of the English Pitt. The evidence against you is here.'

Turning in his seat, the President took hold of something which lay on the floor beside him, and cast it upon the table. Camille recognised his

own valise, and waited. The President, with clumsy fingers unfastened the straps of the valise, and tumbled out its contents upon the table. Amongst them were several papers, which, having been slowly sorted and arranged, were held up before the prisoner.

'Do you know these?' asked the President.

Camille advanced a step with outstretched hand; but the President withdrew the documents, and motioned him back. 'Do you know them?' he demanded.

'Until I have seen them,' returned Camille, 'I cannot tell.'

Men's minds were so strung to suspicion, that even at this common-sense and obvious answer, a murmur ran through the crowded hall, a murmur which bespoke suspicion grown assured.

'Citizen Lamballe,' said the President, 'display the papers to the prisoner. See that he makes no attempt to destroy them.'

The guard on each side of the prisoner laid two brawny hands upon each wrist; and Jacques displayed the papers one by one before him. They were clumsy forgeries, to Camille's eye—forgeries so clumsy, and so ignominiously made, that each document bore for signature the one word 'Pitt,' and they were written in a sprawling and unclerkly hand, in French. Camille having attentively regarded them, spoke.

'I am charged with having these documents in my possession?'

'That is the charge,' returned the President.

'I have no knowledge of them,' returned Camille, 'and they are evidently forgeries.'

'How do you know that?' demanded the President.

Camille unsuspiciously fell into the trap thus set for him. 'The name of the notorious English Pitt,' he answered, 'is William. It is only the habit of the English *milord* to sign himself without the use of a Christian name, and the infamous Pitt, enemy of the great Republic, is a commoner. Moreover, these papers are in French, and not in English. Again, the paper itself is French, and not English. Yet again, the signature and the body of the papers are in the same handwriting, and Pitt is too busy with machinations against the Republic to address a poor Captain of dragoons in his own hand.'

'You are well acquainted with the manners of the English Pitt, Citizen Piquet. You may find that you have defended yourself too well.'

Again an ominous murmur rose from the crowd. 'Monsieur le President,' returned the prisoner, 'since a good citizen of the Republic and a soldier who has shed his blood in her cause, can be charged with treason on evidence so preposterous, I demand my removal, under safe escort, to Paris, where I may encounter judges who can estimate the value of that *griffonnage*.' He nodded his head scornfully towards the papers which lay upon the table.

'Citizen Piquet,' returned the President sternly, 'it is yours to explain how these accusing papers came into your possession.'

'They were never in my possession,' returned Camille.

'They were found here,' returned the President, tapping the valise that lay before him.

'He who hides can find,' returned Camille scornfully.

'That is a defence too obvious to be missed. It was the defence of Edmond Martin at Besançon, of Brasseur at Trouville, of Magnier at Lyons.—How say you, Citizens? Is that not so?'

The conclave of suspicious wisecracks assembled in the interests of public safety, and fully determined to preserve it, though at the cost of half the blood in France, nodded darkly. The attempt to preserve the public safety was, in those days, the grossest and most terrible evil under which France suffered.

'Is any man here,' cried Camille indignantly, 'so mad and blind as not to see the case with which an enemy can hunt his enemy to death by such a means as this?' He tore his right hand from the grasp of the guard, and pointed at the forged papers on the table with a lofty gesture of scorn and anger. 'Am I—a soldier of the great Republic—I will not boast, but I have bled for her on many fields—as likely to turn traitor to the cause I love and honour above all other earthly things, as any hound who has a grudge against me would be to execute this miserable forgery, and palm it off upon you as being in my possession? Who found these papers? Bring me face to face with my accusers!'

'Citizen Tholer!' cried the President.

Citizen Tholer pushed through the crowd—the landlord of the little inn in which Camille had lodged.

'What do you know of these papers?' demanded the President.

'I found them in the valise of Citizen Captain Piquet,' answered the landlord.

'When?'

'An hour and a half back.'

'And who set you to look in my valise?' demanded Camille.

The President extended his hand, as if to forbid response; but the landlord missed the sign, and answered, readily enough: 'Citizen Jacques Lamballe.'

'So,' said Captain Piquet, turning his eyes upon his enemy, 'you have justified your promise.—Monsieur le President, I appeal to your knowledge of my history and the history of my accuser, and I demand of you, have you not known Lamballe's enmity against me, and the grounds of it?'

'Have you any other defence to offer?' asked the President.

'I disown this tribunal,' cried the soldier hotly. 'As a soldier, I demand to be heard before soldiers. I demand a scrutiny of that worthless rubbish there, by which a villain strives to steal the life of an honest man.'

'Prisoner,' said the President coldly, 'the Committee of Public Safety is authorised to investigate all treasonable cases and to pass sentence. Have you completed your defence?'

'I decline to address further a court so imbecile,' returned Camille. His case was hopeless, and he saw it.

'How say you, Citizens?' began the President; and the members of the tribunal fell to whispering with one another; when the plump notary, with all the roses banished from his cheeks, pushed through the crowd, and cried:

'But, Citizens, it is impossible'—

'Let the Citizen notary be removed,' said one member of the tribunal, with a sideward wave of the hand. 'He had best, for his own sake, be

silent. The Republic tolerates no friend to traitors.'

It was evident which way one vote would go. But there were things as madly and as cruelly unjust as the condemnation of Camille Piquet done twenty times a day in civilised and enlightened Paris; and when once a village caught the treasonous scare, there was no hope for the prisoner, however shadowy the charge against him.

'How say you, Citizens?' asked the President again.

'Death,' said one. 'Death,' said another. 'Death,' said one and all.

'To be removed in safe keeping,' said the President, 'and to the guillotine in four-and-twenty hours.'

A shriek from Marie's lips rent the air of the crowded hall; and Camille, with a white despairing face, cried: 'Vive la République! But,' he added, 'Heaven preserve her from her friends.' Then he turned, and with a firm step, strode through the crowd, closely followed by his guards.

#### CHAPTER IV.

The place of detention to which the guard conveyed him was a chamber in the house in which Jacques Lamballe had his dwelling. Entering from the crooked village street, they dived down the tortuous stair three stories, and then paused. Three stories below the street on one side, and three stories above the brawling river on the other. Viewed from beyond the river, the great rambling pile of building of which Captain Piquet's prison-chamber formed a part, was curiously picturesque. Overhanging chambers projected from it here and there in the oddest way. There were half-circular turrets dotted about its surface without apparent aim or object; buttressed windows projected from its scarred and time-eaten surface; and every chamber of the seven separate stories which composed the building being in itself lofty, the forehead of the edifice seemed almost to touch the clouds. Jacques, as we have seen already, lived in the topmost story. Camille's window was in a straight line below his, in the fourth story, counting either from the river or the roof.

Arrived at the place of imprisonment, Jacques dismissed his companions, and after a parting jeer at his prisoner, shot the heavy bolt, and mounted guard outside. Camille went at once to the window, and finding its crazy fastenings insecure, broke it open, and looked out, below and aloft. Below him, a sheer fifty feet of wall; above him, a sheer fifty feet of wall, and no way, even for a cat or an ape, to travel by. Satisfied of the hopelessness of escape by this one brief glance, he closed the window impatiently, and sat down, to chew the cud of his own fancy.

One brief hour saw everything so changed! If he could but send a message to his General, a word conveying news of his peril to his Colonel, there might be some hope for him. But now there was not even a hope that his innocence would be avenged. For he knew, no man better, the spirit of the time. He could call to mind a score of cases in which patriotism as unsullied and unselfish as his own had found its reward in death at the hands of ignorance and political fanaticism.

He was prepared to meet death like a Christian and a soldier; but to die under this undeserved shame was bitter and horrible beyond all words. Every now and again he rose up in fiery protest against the injustice of his sentence; but as often as he did so, he fell back into the rough seat provided for him, and sank in a wordless despair.

Meantime, Jacques paced the dusky corridor, chewing the sweeter cud of vengeance—gratified. He had been handsome once, and wealthy, for the place and time, and had the chance of a happy life before him, and had believed that it was but necessary to speak to secure the hand of the only woman he had ever cared for. And she, though below him in birth and wealth, had laughed at his suit; and he had long since found out why. That handsome cadet of dragoons had come between him and his love, and had stolen her affections from him; and for three long years he had waited for revenge. Now that he had it, was it altogether sweet? Strive as he would, he could not close his mind's eyes to the memory of Marie's face, as she had looked at him in the dusty sunlit country road, two hours ago. Strive as he would, he could not close the ears of memory to the cry with which she had responded to the hearing of her lover's doom. He walked, with his carbine tucked under his arm, and his right hand thrown negligently across the barrel, to and fro, to and fro, to and fro, the clank of his heavy *sabots* marking off the swift remaining seconds of his enemy's life, and he himself aware of that, and so haunted by the fancy, that he must needs stand still, fighting accusing conscience down. He walked on again, and still the fancy haunted him. At every clank of the heavy wooden shoes, his enemy a second nearer death! He tried to exult over that awful prospect; but his heart chilled within him, and he had no power to boast about his wicked victory, even to himself. Again the haunting fancy brought him to a stand-still. Drink and play had dulled his emotions, muddled his memory, and frozen his heart; but he could not forget that he had been a man of honour once, and that half-a-dozen years ago the bare mention of such a scoundrel as he now was, would have fired his soul with indignation. Spurred by accusing conscience, he tramped on again, up and down before the prisoner's door, and over and over again the heavy tramp seemed to measure off so remorselessly the brief remaining seconds of his enemy's life, that a cold sweat broke out upon his forehead, and his hands grew clammy. It was still broad daylight outside; but the corridor in which Jacques kept watch and ward was dark by this time. He could hear an occasional tramping far above him; and whenever a sound of footsteps came upon the stair, he hoped for his relief from a task which grew rapidly more and more unbearable. A sound of wooden shoes on the stair in the upper story! He listened, hoping for its further descent, but fearing to hear it die away in one of the long corridors. The steps descended another flight; and still he listened, and hoped, and feared. They began upon the third; and he breathed more freely. 'Who goes there? The relief!'

'Not yet, my friend,' said a voice in answer. 'I am a good Republican; but I am not stone neither, and I have said to her again and again:

"It rests with the Citizen Lamballe, and not with me."—Speak for yourself, Citizeness.' And with this enigmatic speech, the owner of the voice retired.

'Who's there?' cried Jacques, after a pause.

'Is that Monsieur Lamballe?' asked a girl's voice. 'Oh, good Monsieur Lamballe, have pity. Permit that I see him once more. It is not much that I ask. It is only to-day that we were betrothed; and he is innocent, Monsieur Lamballe, he is innocent! And he has fought for the Republic, and is faithful to it. Have pity, and let me see him once more.'

The hoarse voice of Jacques Lamballe was hoarser than common as he threw open the door, and cried: 'A visitor for the prisoner Camille Piquet.' Turning to make way for Marie, he caught sight of her agonised face as she passed him; and then closing the door, began his walk of doom again, with every clank of the heavy wooden shoes another second stolen from the fast dwindling span of the prisoner's life. Up and down he went, his thoughts busy with terrors all the while. He could hear the voices of the prisoner and his visitor. He could hear the sound of weeping and the low murmur of Camille's voice of comfort. The voices and his own tormenting thoughts accused him so that he could bear them no longer. He struck the door of the prison chamber roughly open with the butt of his carbine, and thrusting his head through the doorway, cried, with his eyes fixed upon the ground: 'You have had time enough there. You must leave.'

'Another minute, Citizen,' said Camille quietly.

'Be it so,' responded Jacques; and leaving the door open, he set out upon his march again. Turning back at the end of the corridor, he could see the broad band of sunlight streaming across it through the open doorway, with the shadow of two embracing, kneeling figures in it; and though he clamped by as noisily as he could, the loudest clatter of his *sabots* could not cloak from his ears the sound of Camille's voice of prayer. When he turned again, he could see by the shadow on the floor that the prisoner had arisen; and as he passed the doorway with averted eyes, a cry of most eloquent despair and farewell rose alike from Marie and from Camille; and the girl, rushing blindly out, would have fallen, but that Jacques involuntarily reached forth an arm, and, for a moment, supported her. Before that momentary support was withdrawn, the girl looked up, recognised him, and fell upon her knees.

'Oh, good Monsieur Lamballe,' she cried, fawning upon him in a very agony of entreaty, 'he has been betrayed by some enemy. He is innocent! He is innocent! I call the saints to witness he is innocent! Who could have put those wicked, wicked papers to be found there?'

And all on a sudden, a vast unrecognisable tide surged up in the heart of the ruined drunkard, and he took pity on his enemy and her. 'I did!' exclaimed Jacques. 'Yes, Citizen! Yes, Marie, it was I!—Take thou this carbine, Camille Piquet, and rid the earth of a villain. Nay, I will save you yet, though I die for it. I will save you yet.—Hurry away, poor child!' he said hastily. 'Drop thy veil, and hurry. It is dangerous to weep for a condemned enemy of the Republic. Go!'

But Marie made no sign of movement; and

Camille looked at him with folded arms and compressed lips, in silence.

'I see the way,' said Jacques hoarsely and rapidly. 'When night falls, do thou and thy father fly for the Pont de Chevre in the Passe du Diable. Camille and I will follow. It is my business to post the sentry there, and I will see that he is absent.'

'Is one life not enough for you, Jacques Lamballe,' asked Camille, speaking as if a statue spoke, 'but you must needs betray my poor child and her father to the axe?'

Jacques took a step forward, out of the dusk, and into the broad sunlight, and confronted him. A few minutes ago, he could not have looked his late enemy in the eyes, but he did so now. 'I vow to you,' he said, 'that I mean well by you and yours. Believe me,' he cried, seizing Camille by the hand, 'for her sake and your own, believe me.'

The emotion of all three in this strange scene was a product of the country and the time.

'I will trust you,' said Camille. There was that in the man's face and voice which made it impossible to doubt him. The bleared eyes shone once more with genuine feeling, the loose sensual lips were firm, the bloated features quivered.

'I will save you,' said Jacques, 'if I die. If we die together, forgive me.' He knelt at Camille's feet and kissed his hands, and his face was wet with tears.

'I trust you,' said the soldier; 'and I forgive you.—Go with him, Marie, and obey his directions.'

But Marie was for a while unable to move, until by a great effort she collected herself and left the place.

'At the Pont de Chevre in the Passe du Diable!' were Camille's parting words to her.

'Trust me, Piquet!' cried Jacques, as he withdrew, 'and everything shall yet be well.'

'I have put Love as well as Life into your hands,' said Camille; and Jacques withdrew. He locked the prisoner's door, and beating upon the stairs with his carbine, summoned the relief. A man came, grumbling that he was before his time; but Jacques silenced him gruffly, and took his way up-stairs and out at the front-door, returning to the upper room in a little while with a good store of brandy, which he pushed about among his comrades with such effect that before night-fall they were shouting and singing with huge hilarity, and altogether oblivious of the prisoner. By the time when night had grown dark, the good Republicans had drunk to the health of the good Republic often enough to drown all remembrance of her, and by ten o'clock all three were fast asleep.

It was too risky an enterprise to be attempted, or Jacques was willing enough to have withdrawn the solitary sentry who paced before the prisoner's door; but he had a plan in mind which made this unnecessary. Not a hundred yards away from the front of the house was the village well, and Jacques hastening thither through the dense darkness, severed the bucket from the rope with one swift cut of the knife at his girdle, and gathering up the rope upon his arm, severed it again at the drum of the windlass, and crept cautiously back. The sky was a black blank, and not a light shone in the village street. He had

put off his wooden shoes before starting; and reaching the door, and remembering the enterprise he had in view, he slipped his feet into them again, and stole quietly up-stairs. His companions of the guard still slept; and Jacques, setting the candle on the window-ledge overlooking the sheer descent and the babbling river, measured the stolen rope across his own broad chest from fingertip to fingertip. He made but ten lengths of it; and counting six feet at a length, there were still forty feet to be covered before the river was reached. The stream in itself was not to be dreaded, for it ran no more than three or four feet deep; but the thought of the vast chasm between the end of the rope and the surface of the river, made him pause. Suddenly he resolved. He tied one end of the rope firmly to a stout iron bar which ran across the window-frame, and cast the coil through the window. There was a light in the prisoner's room by his own order, and he saw his line snake swiftly pass the gleaming window-panes.

'So far good,' he murmured to himself. To a man of strong muscle and resolute nerve, the descent to the criminal's window was an enterprise by no means desperate; but how to get beyond? How to utilise the rope again? How at once to make the fastening secure for the descent, and to release the rope when the descent was made? Jacques had his plan. He seized the candlestick, and set it squarely and firmly on the window-ledge beneath the knot. The flame just kissed it. 'I shall have time,' he muttered, 'if he opens the window quickly; and I will die for him or with him.' He crawled through the window, seized the rope firmly in both hands, and began his descent.

He planted his sabot feet firmly against the gray crumbling stone, and hand under hand went downwards. He dared not look below; and crash on a sudden went his foot through a window pane, with a noise and a nervous shock that had well-nigh cost him his hold. Happily for him, the chamber was untenanted, and on he went downwards and downwards, swinging loose after that experience, and grazing his face and knuckles wofully as he went. By and by, he had to use his feet again; for against one of the quaint projections of the buildings the rope hung taut—with his weight upon it—and when he had passed this point, he saw with sudden terror that he swung four feet clear from the face of the wall. And now the gleam of Camille's chamber window was in his eyes, and he strove to touch the glass with his foot to awake the prisoner's attention. But he was too far away. He thought with a swift shudder of the light above ebbing away at the one slender chance of life he held. He strove again to touch the window, and again he failed. But he noticed now, with a revulsion of hope, that the effort had given an oscillating motion to the cord. He repeated it, and exaggerated it, until his foot struck the frame of the window heavily. Next time, striving to get an additional impetus from the frame itself, he burst the window open with a crash. The prisoner ran forward and caught sight of the swinging figure in the half-darkness beyond. 'Seize me!' gasped Jacques in a hoarse whisper; and when he next swung near, Camille clutched and dragged him into the room, but only just in time; for, with a trail of fire, the upper end of

the rope fell through the darkness of the night at that moment, and dropped with a hiss into the river. But Jacques still held the saving cord in his half-numbed hands, and began rapidly to fix it to the window stanchion. 'Down!' he whispered. 'Down for your life!'

'What was that?' returned Camille in the same low tones. 'That trail of fire?'

'I placed a candle beneath the knot above,' said Jacques, 'trusting to reach you before it had burned through. The rope was too short to be of use otherwise. Go down!'

Camille seized the rope and dropped into the darkness, and Jacques followed; and in almost as little time as it takes to write it, they stood safe on the far side of the river—wet and breathless.

'You know the country?' whispered Jacques.

'I could traverse every foot if I were blind,' whispered Camille.

'This way, then,' said the other; and the two set out together. Jacques had lost his *sabots* in the stream; but the loss was a gain to him, for he went silently now, and Camille's quiet step was like a cat's for stealthiness. Without a word, they traversed the black night for two leagues, breasting the hill road which led across the near border into peaceful Switzerland. Jacques had been true to his promise, and had held back the frontier sentry for the night; but as they neared the Pont de Chevre, a voice rang out with 'Qui va là?' and neither of the fugitives answering, a shot followed.

'Run!' moaned Jacques. 'I am hit!'

'Not I,' said Camille, 'without the man that saved me.'

He caught up Jacques' burly figure, and staggered on.

'Run!' moaned Jacques again. 'If I saved you, I betrayed you. Run! you are within five hundred yards of safety. The sentry dare not fire across the bridge.' Another shot was fired. It whistled so close beside Camille's head, that his right ear tingled; but he held on to his burden still, and tore along the narrow and difficult way, as though he bore in his arms not a dying enemy, but every hope of life and love the world could give him. The bridge was passed, and the shelter of the rocks beyond it gained, when a voice cried 'Camille!' and M. Thurot, followed by his daughter, stepped into the road. At that instant, the first gleam of moonlight the night had known irradiated the scene.

'Lay me down,' panted Jacques. Camille obeyed him gently. 'I said I would save you if I died for it. I have saved you, and I die for it. — Do you know,' he questioned the old man, 'why I bade your daughter fly, and bring you with her?'

'To join Camille,' said the old man, bending over him.

'Not so,' said Jacques. 'I had denounced you both for arrest to-morrow. Tell me you forgive me!'

They knelt about him, and they spoke the words he waited for, and spoke them from the heart. And even in hearing them he breathed his last.

Many a year afterwards, when France was prosperous and content, a gray-haired General of cavalry, by name Camille Piquet, made a journey

to that place; and on the spot where Jacques had breathed his last, he set up a plain marble cross, with this inscription only—'July 24, 1793. He sinned and he amended.'

## THE RECENT SHETLAND DISASTER.

BY A SHETLAND LADY.

Calm and bright broke the morning of the 20th July last, cheering the heart of many a Shetland fisherman, and bringing the promise of favourable fishing weather. Hitherto, the deep-sea fishing, or *Haaf* as it is called, had proved a failure, owing to the continued unsettled stormy season. An adverse summer had succeeded a winter of almost unprecedented severity, during which intense frost and deep snow had reigned supreme from the beginning of October till April. There is little wonder, therefore, that this fine calm morning lured many to try once more if the deep sea would yield up its harvest. Necessity drove them on. In many cases, the live-stock had been greatly reduced by the severe protracted winter; even the hardy native horses had succumbed; and if bad fishing weather continued, starvation both for man and beast would stare them in the face.

Our household happened to rise very early on that particular morning, as my husband was going south; and as no steamer called that day at our island (Unst), he had to leave by a small boat, in order to catch the steamer, due about one P.M. at Parrao, in the neighbouring island of Yell. 'There goes Nickie Johnson again, poor fellow, to try the fishing,' remarked my husband, as we both looked out together upon the lovely scene. The bright blue ocean was certainly tempting, as it lay sparkling in the early sunshine. Nothing either in the atmosphere or in the gentle ripple on the water warned the poor fishermen that, though wind and water were resting, this was but the calm before the storm.

There was not a boat's crew in all the many islands but went forth that morning with hope once more dawning in their hearts. In cases where a fisherman happened to be ill, the crew was hastily made up by a willing substitute, who offered to go in place of the ailing man, and every one felt that such a morning should not be lost; so all the able-bodied men from many a hamlet round hopefully embarked, leaving the women to indulge in more cheerful thoughts and words than had been possible for many a day. There was no foreboding of evil, to mar the pleasures of anticipation; the weather was settled-looking. Shetland had no warning of the predicted storm, having been cut off for six months from all telegraphic communication with the south.

My husband left for the south; while those at home took advantage of the favourable weather to visit a neighbouring isle with some friends. Returning homewards in the afternoon, the *voo* was as smooth as a mirror; and there was not a sound to disturb this ominous calm save the gentle plash of our oars, which served as an accompaniment to our voices, as they rose and fell in the well-known old song, *Weel may the Boatie row*. Very heartily did each one sing the

line, 'Better luck attend the boat,' for truly this was the first day that seemed to give promise of luck to the Shetland craft. *There's nae Luck about the House* was also sung with great animation; for we had all felt the parting with our especial head of the house, on this our day of pleasure. No anxiety accompanied this feeling; his temporary absence was just what is termed in Shetland 'a great miss.' But, alas! how many happy wives in our islands, who that day were singing, or feeling in their hearts the words of this song, were doomed never again to welcome home their beloved 'guidman.' For some, it was destined there should be wailing instead of welcoming—the drapery of woe in place of the festive garments.

Just as the last hour of the 20th July was passing away, the storm broke with sudden violence, and the poor fishermen, exposed to the fury of the elements, were suddenly engaged in a battle for life. Alas, for the poor women, rudely waked from sleep, to find that the howling wind was no dream, but a dread reality! When daylight broke upon the 21st, groups of women could be seen along the shores, anxiously straining their eyes for the first glimpse of the returning boats. As first, one, and then another, hove in sight and came in, the excitement was intense. As they listened to the recital of each fisherman's experiences of what had proved to be the most frightful night that had ever been encountered by the present generation of fishermen, the hearts of those whose loved ones had returned to tell their thrilling tale, swelled within them with overflowing gratitude for their preservation. All the anguish of hope deferred agitated the bosoms of those whose friends were yet battling with the waves, or—and this little word *or*, when it crossed their minds, turned the anguish into despair. Many a sad, weary mile was that day trodden over the isle by feet that seldom left the fireside. Excitement gave strength to the aged and infirm; and a spirit of restlessness impelled those whose dear ones were still amissing, to wander from point to point, where tidings were most likely to be heard.

By four o'clock, all the boats in Unst had returned but two, and whispers began to be heard of wreckage which had been recognised by some as belonging to one of the missing boats. Before nightfall, the agony of suspense was ended for some; the relatives of one boat's crew had the joy of hearing that their loved ones were safe on an adjoining island; while, beyond doubt, all the brave hearts that had manned the other boat had perished. Over one hamlet, the rays of joy and happiness mingled with the beams of the setting sun; while in the other, the hope of happiness was extinguished with the sunset, and the long sad night of grief and desolation set in.

Thus ended that sad 21st of July. But I feel that it is as impossible for me to describe what my own feelings were on that dreadful day, as it must be for any one but a dweller in these islands to understand the strange thrill of excitement, alternating between joy and sorrow, hope and despair, that seemed to pervade the very atmosphere. Yet what was the loss which our island sustained, compared with the neighbouring one of Yell? In that island, there was lamentation and woe; six boats were lost, leaving thirty-six desti-

tute families. It was terrible, indeed, to hear the account of that awful night from the survivors; and the wonder is that the loss was not greater, considering the frail nature of the Shetland open boat. The much safer decked boats these poor fishermen cannot yet afford to use. A number of the wealthier class now employ large double-decked Scotch-mainland boats; and it is worthy of note that of these, not one was lost that night.

There is not a Shetlander but feels most deeply the heartfelt sympathy and noble generosity which all classes in the south have shown towards the poor bereaved families in these islands; and while I write, a fund has been raised, which has turned out to be amply sufficient not only to secure from want those left destitute by the present disaster, but also for future emergencies. But in common with many others, I could have wished that, instead of a fund being raised for relieving the wants of those whom the sea has made widows and orphans, something could have been done to *prevent* so many widows and orphans being made. I think I may safely say that, thanks to the response which the appeal for aid has received, not one of the bereaved will suffer from want, which otherwise would have overtaken them. But what human sympathy or charity can heal the broken-hearted widow? She may receive money with gratitude, for without money her helpless children would die of starvation; but her life must henceforth be overshadowed with sadness. Could not some part of the money collected be funded, to assist the poor fishermen to get larger and safer boats? These boats, now used by the wealthier merchants, cost four hundred pounds, a sum far beyond the reach of the common Shetlander. But some system could surely be introduced by which safe boats might be provided for those willing to pay an annual sum for their use. Why should not fishing-boats be open to inspection as well as larger vessels, which have now all to bear the charmed mark 'Plimsoll'? Surely the lives of the one boat's crew are as valuable to their friends as those of the other.

I merely offer these suggestions from the point of view of a Shetland wife. While doing so, I truly sympathise with those who so lately were happy wives also; and feel most keenly at the same time how much more the preservation of my husband's life is to me, than any assistance which could have been given, had he also perished in the storm. I would close this brief narrative by expressing the hope that those kind friends in the south who have shown their sympathy, not in words only, but in deeds, may be able to suggest some plan by which safer boats may be brought within the reach of my poor countrymen.

[Since the above was written, the fishing population of Scotland—and indeed elsewhere in the British Isles—have again had to suffer from the terrible devastation of wind and waves. On Friday, the 14th of October, a terrific storm of wind broke over Scotland, falling with fearful effect on that portion of the east coast between the mouths of the Forth and the Tweed. In a few hours the work of destruction was done, many boats being overwhelmed and sunk or dashed to pieces on the rocky coast. In all, about one hundred and ninety-five lives have been lost, leaving

behind to mourn for them about one hundred widows, and nearly three hundred orphan children. The sympathy of the country has been strongly awakened for the fishermen by the sad catastrophe, and all that money is able to do to make up for the great loss which so many poor families have sustained, is being done with no unsparing or ungrudging hand.

Still, the problem for the future is, can nothing be done to render deep-sea fishing less liable to such terrible and disastrous visitations? For instance, in all the correspondence which has taken place in the daily press on the subject, we have observed no reference to what has often been urged in these pages namely, the use of oil at sea in allaying the *broken water* during a storm. We cannot help thinking that had the boats caught in the recent storm carried each of them a bag or two of oil, which could have been floated alongside, punctured so as to allow the oil gradually to escape, some of the boats that were swamped in the surf might have weathered the storm in safety; for it has been proved that waves, by the timely spreading of oil—or even the liver of the larger fish, such as cod, if such be in the boat—are kept from breaking, and the boats would thus, probably, have been enabled to ride out the storm. People are, in general, singularly averse to accepting innovations on old customs and habits; but when the innovation, as in this case, is so cheap and simple, and can in no circumstances do any harm, while it may be the means of saving many valuable lives, it is surely to be regretted that some practical steps are not taken by those connected with the fisheries to insist that every fishing-boat shall carry a supply of oil in case of emergency, and thus have the matter fairly and fully put to the test.—Ed.]

## MY LAST DETECTIVE CASE.

## CHAPTER IV.

THIS speech from my wife staggered me more than all I had heard before; but of course I got up and went to the parlour at once, she following me; and there, to my astonishment, I found Big Ned Hoker, one of our constables, and reputed to be the strongest man in the division. He was in plain clothes; but of course I knew him well.

'Why, how did you come here?' was my very natural inquiry.

'Mrs Nickham called for me in a cab, sergeant,' replied Hoker; 'told me you would want me to assist in a capture.'

'Yes,' said Mrs Nickham; 'that's just how it is, Dick. You have surely enough evidence now. Helliip is in the house—the watch can be seized in Stobble Street. To-morrow he may be a hundred miles away—so may the watch. Helliip may have had his suspicions of you, as you have had them of him.'

Yes; she was right. She always is; her equal for clearness and decision I never did see.

It was as well she brought Big Ned with her; for although I may say without any boasting that I was not afraid of Helliip or any one else, yet I knew I was not the man I had been, while Helliip was likely to prove a desperate and dangerous

customer. A few hurried questions told me that Hoker had come fully provided for a service of danger. He had with him not only his staff and bracelets—by which I mean handcuffs—but a revolver, and I always kept similar auxiliaries in the house; so I resolved to lose no time, but to make the capture at once. As I was saying this, a cab dashed up to my door at a great rate, and a thundering knock followed. My wife hastened to the door before the servant could come, and admitted a stranger, who, saying hurriedly, 'Mr Helliip,' dashed past her, and ran upstairs. This I saw through the partly opened door of the room in which we were; but I was a great deal more surprised to see Mrs Nickham slip after him stealthily, and nearly as quickly as he had gone up. I stared at Ned; he was not a very ready person at any time, so he could do no better than stare at me in return.

There was a momentary bustle above; but before we had time to speculate upon it, Mrs Nickham ran lightly down the stairs—I had not known her run so quickly or lightly for years—and quite rushed into the parlour. 'Nickham!' she exclaimed, in a whisper; 'it is Jacobs!—the pawnbroker. I knew him, and followed him up-stairs. I heard him say: "Helliip! I am afraid we are in an awful mess. One of my safest customers tells me he saw the wife of Nickham the detective leave our shop, just after your wife left. What could she have wanted there?"—"Nickham!" says Helliip; "why, he is my landlord! He lives here—he is in the house now."—"Then I am blessed if he is not trapping you," said Jacobs; "and you had better clear out of this."—My wife did not stay to hear any more, but hurried down; and by a bustle which was soon heard up-stairs, it seemed probable that Helliip was about to take his friend's advice.

Directly afterwards, I heard his door open; there was no time to be lost; so, stepping into the hall, I was just in time to see Helliip coming down, followed by a man, whom I knew at once as the pawnbroker, he being, indeed, an old acquaintance. Jacobs started and slunk back, as, by the light of the hall-gas, he saw me come out to meet them; but Helliip pushed resolutely on.

'Mr Helliip,' I said, 'I cannot allow you to leave the house. I must ask you to see the inspector with me, to give some explanations, which I hope will satisfy him.'

'Get out of my way,' he cried, 'or I'll lay you senseless on your own floor.' As he spoke, he drew his hand from his coat-pocket, and I saw that he held a life-preserver.

'Don't let us have any violence, Helliip,' said the pawnbroker, who was trembling with fear; 'there is no occasion.'

'Shut up, you fool!' exclaimed Helliip savagely. 'You are a dead man, Nickham, if you try to stop me, or to follow me an inch.' He raised his life-preserver as he spoke. I had my hand upon my pistol; but there was no occasion to draw it, for, having passed by the folding-doors from the front parlour to the back, Big Ned at this moment stepped from the latter room into the passage, and reaching Helliip in a single stride, flung his arms around him with a grip which held him as helpless as a child. I followed this up by clicking the handcuffs on him before he could recover from

his astonishment sufficiently to make a struggle, or to disengage his arms, which Hoker held pinioned as if in the grasp of a boa-constrictor.

'Oh, my eye!' I heard Jacobs groan, as he saw this done; 'it's all up! There's Big Ned Hoker has got him, and Sergeant Nickham knows—Oh, Mrs Hellip'—to my lodger's wife, who had now come anxiously forward—'Oh, Mrs Hellip, why did you not tell me you lodged in Sergeant Nickham's house!'

It was too late to ask such questions now. Mrs Hellip burst into a flood of tears.

Hellip himself did not speak a syllable, although, by the motion of his lips, I could tell how bitterly he was anathematising us. I have often seen such symptoms. His disagreeable fixed smile was completely gone, and he wore instead a more savage expression than I ever remember to have seen in all my experience, on the worst of faces. I knew his mood was dangerous, so I told Big Ned to stand by him, giving him a hint as to what was in the man's mind, while I attended to Jacobs and Mrs Hellip.

There was not much trouble with these, except for the pawnbroker, who was disposed to resist being handcuffed. I got them on, however; and by that time our girl had opened the door and told the cabman he was wanted. Luckily, the cab was a four-wheeler. Only think of Jacobs having provided it so opportunely! I would not attempt to start, however, until the officer on the beat had come up. We sent the girl off to find him and get another cab, for I had no faith in Hellip's keeping quiet; he was too quiet indeed, to please me. When he saw what my intention was, and saw the extra officer come in, he spoke; it was only one sentence that he said, and it was addressed to me. I need not repeat it; it was too awful to go into print; but in all my life I had never seemed to hear the language of bitter hate and balked revenge till then.

Big Ned, with the second officer and the two men went into the first cab; I followed in the other with Mrs Hellip; and I am happy to say we lodged them all in safety at the station-house; though not without some difficulty with Hellip, who, handcuffed as he was, might have done some mischief, had Big Ned been alone.

There is not very much more to be said about Hellip. The possession of the watch would no doubt have been sufficient to convict him; but we easily got hold of the man who had recommended Jacobs as a safe buyer—he who wrote the note of which Mrs Nickham made such good use. This man—Hocking—had, it turned out, been security for the money borrowed of Daryett; so he did not stand in a very safe position, as he soon saw, and consequently was anxious to tell all he could against Hellip, to save himself. He declared that Hellip had deceived him about the bill, which he said had been duly taken up, and in proof showed it to Hocking. However this really might have been, Hocking's evidence was accepted, and then there was no chance for Hellip.

Of course the reader knows that Daryett's house was robbed, and himself murdered, to get this bill, which Hellip was totally unable to meet. Then the latter's sudden interest in my movements was of course to enable him to know if I was likely

to get on the right track. So was his rheumatism a sham, and his rides in cabs all a blind; he was watching me hour after hour, and that is how he found I was consulting the spiritualists. Being extremely superstitious, as many criminals are, he took the alarm, and determined to see for himself what power these people had. The reader knows the result, and that he would have been wiser had he left well alone. He was tried at the next assizes, and paid the penalty of his crimes with his life. I never experienced less pity for any man who had been through my hands, as, although he had lived in my house, I had never felt the slightest friendship for Hellip, and indeed never cared to talk to him.

I did not forget Charley the 'clairvoyant,' who had fairly earned a share of the reward; but although I satisfied him, I did not fare so badly. Mrs Nickham was presented with a very handsome testimonial for her conduct in the matter of Jacobs, by several influential firms who had long been trying to catch the crafty old rascal. He got seven years; I don't suppose he lived through it.

My story may be said to have ended with the apprehension of Hellip; but I was destined to hear a little more about the case, in a most uncommon manner, more than a twelvemonth after. The incident interested me so much, that I think the reader will be pleased to hear it. I had left the police altogether; for, as I have hinted, I expected to receive my pension at the end of the year. I did get it; and was presented with a silver cup by the division, together with a complimentary address on vellum, which is framed and hung up in my front parlour.

I had left the service about six months, when, one afternoon, a cab drove up to my house; and I saw a gentleman get slowly out and come to the door. He asked for me, and when shown in, began by saying: 'I believe I am speaking to Mr Nickham, the celebrated detective, who was engaged in the Upper Broughton Street case?'

'I am—or was Sergeant Nickham,' I said; 'but I have left the police now, and must refer you to the authorities for any information.'—

'Not for my particular information,' he went on, interrupting me without any ceremony, though I observed that he spoke with some difficulty, as if he had blown himself. 'I want to ask about Mr and Mrs Brake, who were at first suspected of the murder. What kind of people are they?'

I was able to give a very favourable report of the young couple, and added, that I considered Mrs Brake had been hardly used.

'So do I,' said my visitor, speaking slowly. 'Your account pleases me very much; and I shall go and live with them. My name is Daryett; I have just returned from Australia. I am heir to the miserable old creature who was killed in Upper Broughton Street.'

From what the old gentleman had so far said, I could see some good for Mr and Mrs Brake directly; but I was not prepared for what followed.

'The money is no good to me, sergeant,' he continued. 'I have enough of my own, having been of late a lucky man; but anyhow, I don't care for wealth or success now. My wife and only child died just as my luck turned; and a chill, which I caught last year, has settled on my lungs,

so that I know I cannot live long. I have no friends there that I care for; so I took a fancy that I would come over to the old country, and end my days with some one akin to me. I thought, from all I had heard of you, that you were a respectable man, and am glad to find you speak so well of these people.'

And actually this man, who proved to be what he announced himself—old Daryett's heir, from Australia—went to Mr Brake, made himself known, insisted on living with the young couple, took a larger house, so that they should not be inconvenienced, and settled down with them.

Little Mrs Brake called upon me several times to say how they were getting on; at her second visit, she was accompanied by a servant, smart and little like herself, carrying a baby. (We never had any children; but I was always amused to see how proud mothers, especially little mothers, like Mrs Brake, are of their babies; as if no other babies had ever been heard of before.) She always thanked me for my kindness in speaking well of them to Mr Daryett, and attributed a great deal more credit to me over the affair, than I ever deserved. She told me also that the poor fellow's foreboding was too true, as he was gradually sinking.

At last, she came dressed in black. The Australian was dead. He had left them nearly the whole of his own wealth, in addition to his inheritance from old Daryett; so that, after all, the young couple were a great deal better off than if the miserable old fellow had done all they expected. To my surprise, the Australian had left me nineteen guineas, a sum which did not pay legacy duty; and, in consideration of my report to him, for which I had already been sufficiently thanked, Mrs Brake presented my wife with a silver teapot, milk-jug, sugar-basin, and tongs; which could not have been bought—for I asked a friend in the trade—under five-and-forty pounds. It was very handsome of the young people, who soon after moved away, and went to live a long way off in the country. Although I never saw them again, I heard once or twice of them, but not of late years; however, I heard they were living in very good style, on their own property.

So I reckon that, taking all things into consideration, there was a satisfactory finish to My Last Detective Case.

## THE MONTH.

### SCIENCE AND ARTS.

THE late disastrous gale, which wrought such havoc on both sea and land, particularly among the fleets of fishing-boats on the east coast of Great Britain, has been the means of calling forth many suggestions as to the precautions to be taken for averting these calamities. Telegraphy should be improved, a larger class of fishing-boats ought to be employed, and so forth. But what signifies these and other recommendations, if fishermen will not pay scrupulous attention to storm-warnings, but rush off to sea in defiance of indications that foretell speedily coming disaster—nay, who even neglect to carry with them a bladderful of

oil to allay the devouring surf? As regards telegraphy, those whose lives are spent ashore, and to whom a storm means inconvenience rather than risk, are loud in their demands that our electric wires should be carried underground instead of overhead. Germany, at the cost of half a million of money, has just completed this necessary reform in the telegraphic system; and Great Britain, it is thought, should not lag behind in such a useful work.

It is the opinion of electricians that the buried wires, although more costly at the outset, would prove to be an economy in the end. Our wealthy railway Companies might surely lead the way in this reform. When we consider that our boasted block system is dependent upon the perfection of the electrical apparatus, and that many lives may be lost through the break-down of wires and posts, to say nothing of the obstruction caused by their wreckage across the rails, we may justly maintain that the change ought to be adopted.

The first electrical tramway in the United Kingdom has been commenced at Portrush in Ireland, by the ceremony of turning the first sod. The tramway will be under the direct auspices of Dr W. C. Siemens, who is not only a director of the Company, but a large shareholder. The chairman, Dr Traill, calculates the cost of haulage by horses at about elevenpence per mile, by steam-power about sevenpence, but by electricity he considers that the working expenses need not reach one penny per mile. In anticipating this enormous reduction in the cost of working, he takes into consideration the circumstance that each car will carry its own locomotive power, saving thereby the cost of fuel and of stokers and drivers, and what is more important, the absence of heavy engines to wear away, by their friction, the permanent way.

Major Lauer of the Austrian Engineers has been experimenting upon a new method of blasting rocks without following the usual plan of drilling them with holes for the reception of the cartridges. The cartridge used is a cylinder charged with dynamite, which is simply placed against the rock to be shattered. Its explosion is brought about by electrical agency, and the system is said to work well and economically. The rock is split into such small fragments, that the debris is easily removable, and the expense of drilling is altogether saved.

Tidings of a new explosive also reach us from Austria. The invention of an English engineer, the new compound is intended to replace gunpowder in the use of small-arms. The initial velocity is said to be much greater than with gunpowder; it does not foul or heat the barrel of the weapon, and the smoke of the discharge is almost nil.

Some novel experiments have lately been carried out at Woolwich Arsenal, with a view to test the effect of limiting the recoil of heavy ordnance. The gun chosen for the test was one of the new

six-inch breechloaders, which, for safety's sake, was mounted inside the bursting cell built for the destruction of the *Thunderer* gun. Behind the gun were fixed hydraulic buffers, which, by suitable attachments, limited the recoil of the weapon to any desired extent. Altogether, six rounds were fired; the recoil allowed varying from six inches in the first discharge to nothing at all in the last. The gun seemed to suffer in no way from this unwonted treatment; but the velocity of the projectile showed a slight increase. These curious experiments will shatter many old theories respecting the recoil of heavy guns, and will probably lead to many important modifications in structures designed for defence.

The *Scientific American* publishes two photographs, which, if not particularly pleasant to look upon, form a good illustration of the marvellous rapidity of the gelatine process. One of these pictures represents a mule, belonging to an engineering school at New York, which it had become necessary to destroy. The opportunity of killing it was taken advantage of for the benefit of the students. The poor animal is seen standing with a dynamite cartridge fixed on its forehead, in connection with a battery and a photographic camera, so arranged, that at the instant of explosion, the photographic plate can record the occurrence. The other picture depicts the moment of execution. The mule is headless, but has not yet had time to fall.

The recent outbreak of cholera among the pilgrims at Mecca will not surprise those who have had the good fortune to read a book lately published, *Six Months at Mecca*, written by Mr T. F. Keane. The author is one of two or three Christians who have risked their lives in performing, for the sake of curiosity and adventure, this celebrated pilgrimage. The description which he gives of the filthy habits of these devotees—among whom the principle of vitality, as exhibited even in the most objectionable of insect pests, is considered sacred—is almost beyond belief. He also speaks of the nauseous flavour of the water from the renowned well Zem Zem—which tradition asserts is Hagar's well in the wilderness—of which every true believer is bound to drink copiously. A sample of this water has lately been received in England, and subjected to analysis; and was found to be a most horrible compound, rich in sewage. There need be no wonder, then, that cholera is found under such conditions; the only wonder is that Mecca is ever free from its ravages.

In a letter to the *Times*, 'A Brazilian' corroborates the remarkable results obtained by M. de Lacerda in his endeavours to find a specific for the bites of poisonous snakes, which cannot but be regarded as of immense interest to the world at large, and especially to India, where the lives of so many thousands of human beings are annually sacrificed to the bites of poisonous reptiles. The remedy consists in injecting into the wound a one per cent. solution of permanganate of potash—a preparation which is better known under the name of *Condy's Fluid*. In carrying out these experiments upon dogs, the subjects were first inoculated with the poison, and afterwards with the antidote. In only two out of thirty cases did the remedy fail to act, and in these the fatal

result was traced to the poor condition of the victims. When the remedy was applied immediately after the poison, the dogs showed no symptoms of injury beyond a very transient agitation. In other cases, where the poison was allowed to get some hold of the system before the antidote was administered, the symptoms rapidly subsided; but there was some prostration manifested for about half an hour afterwards. As a proof that the poison used was in an active condition, other animals, not treated with the antidote, quickly succumbed to its influence. The *Rio* journals have since published an account of three cases in which human beings, bitten by poisonous snakes, were thus cured.

In an outbreak of fire, more can be done towards its extinction in the first few minutes than at any subsequent period. It is, therefore, a matter of considerable importance to have at hand the means of coping with the infant before he becomes a giant, and one or two contrivances which may be styled domestic fire-engines, have been invented to meet this want. One of these, Dick's Chemical Fire engine, has lately been the subject of some experiments on a vacant piece of ground near the Thames Embankment. A large pool of tar and petroleum was extinguished by it in sixteen seconds after ignition. A naphtha-sprinkled stack of boards and shavings was put out by two engines in twenty-six seconds, including the time occupied in preparing the machines for action. The principle of the contrivance, which is of the well-known 'Extincteur' pattern, is based on the suffocating power of carbonic acid. A vessel filled with an alkaline liquid, is charged, on the alarm of fire, with carbonic acid by the breaking of a contained bottle of vitriol. This is done by the forcible depression of a rod on the outside of the case. A tap is turned, and the liquid—a deadly foe to every kind of combustion—is projected with great force in any required direction. The experiments referred to were conducted by Mr J. Sinclair of Leadenhall Street, London.

The late appalling catastrophe at the theatre at Nice, when so many persons were burned to death, has once more called attention to the very inadequate provision which is generally made against such occurrences in places of public resort. The Berlin police authorities have lately issued some stringent rules to which the theatres in their jurisdiction must conform. From these regulations we select the most important: Each theatre must be in telegraphic communication with the nearest fire-brigade station. The separate gas systems of the stage and the body of the theatre must each be capable of control from the outside of the building. Solid fire-proof walls must encircle the stage, and the proscenium opening must have a metallic curtain only to be raised during rehearsal and performance. All doors and other openings between stage and different rooms must be fire-proof, and open outwards only.

One very necessary precaution is not mentioned. We mean periodic attention to the state of the hose and fittings provided in all large buildings in case of fire. In many such places, we are accustomed to see brightly burnished brass taps and hydrants—with rolls of hose neatly hung up beside them—upon which the most fastidious could not find a spot of dirt. But how would this dried up leathern hose behave when suddenly

uncoiled and subjected to the pressure of a head of water? In all probability, it would burst at the moment when it could do most good. More than one large fire has lately defied the efforts of its first discoverers, by the sudden bursting of the long neglected piping. Fire-drill—in which all employes should have a defined place—ought to be the rule in every large establishment, if only for the purpose of using the hose and keeping it in order.

The use of the electric light in theatres will, it is hoped, do away with the exceptional risks to which such buildings are liable. The introduction of the new light is likely to cause a great revolution in the beautiful art of scene-painting, which, in the hands of such men as Stanfield, Telbin, and others, has been brought to such perfection in this country. Hitherto, it was customary, in order to correct the yellow glare of gas, to use a preponderance of blue in the various tints; and any one who has had the opportunity of seeing such work by the light of day, is at once struck with this peculiar feature. Purple shadows are no longer purple, but are nearly bright blue. Foliage which looks natural enough by gaslight, is by daylight a confused patchwork of green and blue; indeed, 'scene-painting' has, probably from this cause, become a term of reproach which is occasionally applied to the efforts of the aspiring artist. The introduction of electricity has changed all this, and scenic artists are asking what they are to do. It is clear that their simple remedy is to paint their scenes by daylight, or by the electric beam which is to illuminate them when finished.

The establishment of a public Aquarium in most important cities has naturally given a great impetus to the study of the habits of fishes. It has long been a disputed point whether fishes are subject to the phenomenon of sleep, and rather a difficult one to determine, seeing that the creatures have eyes to which no closing lids are attached. It seems certain, however, from observations conducted in the Berlin Aquarium, that carp at least are under the power of Morpheus. In October, they commence a kind of winter sleep, placing themselves in unusual attitudes near the bottom of the tank, and refusing to rouse themselves unless food is offered to them. Even this bait does not succeed with some, who require, like certain higher animals, a good shaking before they will 'get up.' That this state cannot be ascribed to any abnormal condition of health, is proved by the readiness with which food is taken, and by the general good condition of the fishes.

Mr S. G. Colquhoun, of 1 Royal Terrace, Edinburgh, has patented a new form of Continuous Brake, which, from a model we have seen, seems worthy of the attention of railway engineers. Unlike other brakes, it is intended more especially for goods and mineral trains, which are now dependent upon the very inadequate power represented by the handbrakes on the engine and guard's van. It is evident that this feeble force can have but little control over a heavy train of trucks when proceeding down a steep incline; and it is to meet this want that the new brake is now brought forward. Each truck is furnished with an independent brake, which is always 'on,' except when the pull of the engine on the couplers—with which the brake is in contact—releases it. Thus, so long as the engine

is exerting its pulling power, the wheels of the trucks are free; but directly this pull is removed, the brakes grip the wheels, and they are soon brought to a stand-still. An electric catch on each truck—under the control of the driver—releases the wheels, when it is desired to back the train. The model, we understand, may be seen at Messrs Thomson & Co.'s, patent agents, 96 Buchanan Street, Glasgow.

Another contrivance against accidents of a different class is represented by Smith's Steam Sentinel Safety-valve for boilers. The valve may be described as a combination of the ordinary safety-valve, pressure indicator, and steam-whistle, for it sounds an alarm when the normal pressure is exceeded. It can be fixed to any boiler in a couple of hours, at very slight expense; and when fixed, it cannot be tampered with. When we consider that in England alone more than one hundred boiler explosions, resulting in fearful destruction to life and property, annually occur, we must acknowledge the importance of any simple means for preventing such disasters.

The Phylloxera congress which met at Bordeaux last month, will be watched with interest not only by the people of France, but by the inhabitants of all civilised countries. The threatened extinction of a great industry, such as vine cultivation presents, is a matter of such serious importance to thousands of breadwinners and those dependent upon them, that even the most callous cannot regard it with indifference. The Phylloxera has already utterly destroyed one quarter of the vineyards of France, and it is said that an equal area will soon have to be rooted up on account of its ravages. There are, probably, many who will rejoice that so many thousands of acres may be thus made available for bread-stuffs, and crops which they would describe as being of far more importance than the grape. But, as a matter of fact, the vine will flourish on coarse, stony soils which will not produce even the ubiquitous weed. In other words, if the vines fail, the ground is quite useless for any other purpose. It is noticeable that although the Phylloxera scare has been before the eyes of the growers for about twenty years, only a few thousand acres in the whole of the country have been subjected to any remedial measures. Whether the remedies tried give promise of success, or whether any new method of coping with the plague has been found, we shall soon learn from the Bordeaux congress of practical men.

In 1866, the Society of Arts, London, initiated a scheme for placing memorial tablets on such houses in the Metropolis as had formed the homes of persons eminent in arts, manufactures, and commerce. The following year, the first tablet was erected by the Society in Holles Street, Cavendish Square, upon the house where Byron was born. Nineteen others have since been put up in various streets; six of them, in commemoration of Barry, Hogarth, Newton, Peter the Great, Sheridan, and Walpole, having made their appearance within the current year. The Society have further prevailed upon the corporation of London to co-operate in this useful work, and such tablets will also be erected within the City boundaries. There was some difficulty found in deciding upon the house which was to be honoured with the name of Samuel Johnson, for the great lexico-

grapher seems to have changed his abode no less than seventeen times. The house in Gough Square, where he chiefly compiled the Dictionary, was chosen as the most fitting place for his memorial tablet.

A new compound for artificial building-stone has been produced by MM. Grunzweig and Hartmann. They mix pulverised cork, clay, lime, water-glass solution, and hair together, force the mass into moulds, and dry it by heat. The result is a stone of extreme lightness, non-absorbent of moisture, and not subject to decomposition. Where clay is not at hand, it can be replaced by dry earth, volcanic tufa, or cement.

M. Tissandier, the balloonist, artist, and editor of *La Nature*, publishes in his periodical an interesting paper concerning Carrier-pigeons. One Society alone numbers one hundred and forty members, possessing about four thousand birds. The President of this little clique was the first to offer pigeons to the government during the siege of Paris, since which time the Minister of War has been careful to encourage such societies. Valuable prizes are offered for long flights, and until lately, the city of Paris gave an annual subvention of one thousand francs to the federation. It is stated that pigeons have been known to fly between Bordeaux and Paris in seven hours.

A good illustration of the value of Professor Hughes's Induction Balance, from a surgical point of view, is afforded by a little episode which is reported from the Paris Electrical Exhibition. Mr. Elisha Gray—an electrician whose name is well known in connection with the early days of telephonic apparatus—seemed to doubt the efficiency of the new instrument, and as a test, challenged Professor Hughes to point out by its aid the situation of a metallic splinter which had been buried in one of his fingers for the past thirty years. Professor Hughes accepted the challenge; and one after another, Mr. Gray's fingers were submitted to the scrutiny of the instrument. The contrivance gave its sign when the first finger of the right hand was brought within its influence; and Mr. Gray at once admitted that it told the truth.

The people of Boulogne have just erected a statue of Frédéric Sauvage, whom they credit with the invention of the screw-propeller. In 1832 he constructed a screw, as an improved mode of propulsion for a number of paddle-steamers which the French government were then building. That Sauvage conceived the idea, is not open to doubt; but unfortunately for his claim to the invention, many others before his time had conceived it too. Ninety years ago, James Watt suggested that one of his steam-engines should be used for driving such a propeller. In 1816, Trevethick patented a screw-propeller; and twenty years afterwards it was perfected by Pettit Smith, who was the first to suggest the place it should occupy above the keel of a vessel. In America there are other claimants to the honour of the invention; and doubtless other countries can boast of similar men. The fact seems to be that the screw-propeller is one of those contrivances which are likely to strike a mechanical mind as a naturally easy manner of compassing a certain end, its ultimate perfection growing out of the crude ideas and experiments of many workers, of whom Frédéric Sauvage was one.

A locomotive engine which will burn naphtha in lieu of coal is about to be tried on the railway

between New York and Chicago. In order that the water may be well distributed between the heating surfaces, the boiler has no fewer than two thousand one hundred and seventy-four copper tubes. The result of this experiment will be looked forward to with interest by the engineering world.

Some curious observations have lately been occupying the attention of Professor Dufour, of Morges—namely, the deformed aspect of reflected images in large sheets of still water, owing to the rotundity of the earth. The tower of Montreux as seen from Morges, pictured on the placid face of the Lake of Geneva, is so distorted as to be hardly recognisable. The appearance can, of course, only be seen on very calm days. Had it been more frequent, it would long ago have attracted attention.

## OCCASIONAL NOTES.

### A LOFTY SCOTTISH OBSERVATORY.

Meteorologists attach very considerable value to weather observations made at high levels; hence both in Europe and America steps have been taken for the establishment of scientific observatories on various elevated situations. Following up this object, an observatory was towards the beginning of last summer planted on the top of the highest mountain in Great Britain—Ben Nevis, whose summit is four thousand four hundred and six feet above the level of the sea. This mountain forms one of the wildest and ruggedest ascents in Scotland, snow lying on it for the greater part of the year, its north-eastern side being flanked by a terrific precipice fifteen hundred feet in sheer descent. Mr. C. L. Wragge, the resident observer at Fort-William, has had charge of the lofty observatory established on the summit of the mountain; and from the 1st of June to the 13th of October, a journey was made to the top every day, without a single exception, by Mr. Wragge or an assistant, and careful readings made of the several instruments placed there. But in the terrific storm that swept over Scotland on the 14th of the last-mentioned month, the canvas roof of the observatory on the top of the Ben was torn off by the wind, and the little hut wrecked. On October 27, therefore, Mr. Wragge thought it prudent to ascend the mountain and remove for the season such of the instruments as could not safely be left there throughout the winter.

The ascent and descent of the mountain for this purpose occupied nearly twelve hours. Mr. Wragge and an experienced guide left Fort-William at 5.30 in the morning; the air, though cold, being clear, dry, and exhilarating. At seventeen hundred feet above the sea-level, ground-frost and ice were encountered, and the Ben was seen to be well covered with snow. At two thousand feet they had reached the snow limit; and as the air was still calm, and clear, the views obtained of snow-covered mountains and dark precipices, with the green valleys below and the blue sea beyond, were magnificent. There is a spring of water near the summit, named Buchanan's Well, after the Secretary of the Scottish Meteorological Society; and this was reached at 8.20, nearly three hours after starting. The well was covered in by a snow-drift to the depth of two feet; and when this was removed the

water was found to be clear and unfrozen, though with a temperature of twenty-eight degrees. Its usual temperature had ranged from thirty-six to thirty-nine degrees. Curiously enough, at this great height, the climbers found in the snow the track of a hill-fox, which had evidently been ascending the mountain, as they came on it again some two hundred feet higher. At four thousand feet they reached the Plateau of Storms, so called from the violent gales that habitually sweep across it from the north-east, and which sorely try the strength and nerve of those who make the ascent. The summit was finally gained a little before nine o'clock. The top of the Ben was found to be covered with snow to the depth of six inches, and the sides of the great precipice to the north-east were thickly coated with snow, beaten into them by the force of the north-easterly gales.

It took some hours' hard work to obtain possession of the different instruments, some of them being coated with ice several feet in thickness. Arrangements having been made for descending the mountain, three instruments were left behind—namely, the barometer, which, with its case, was surrounded with a large cairn of stones; and the maximum and minimum self-registering thermometers, which were set by Mr Wragge for the winter, though an endeavour is to be made to ascend the mountain and obtain monthly readings of these. The wet, dry, and radiation thermometers, as also the rain-gauge, were carefully packed and carried down. The travellers quitted the summit a little after two o'clock, and reached Fort-William safely at five o'clock.

'This exploit,' says the *Scotsman* (to an article in which we are indebted for the above details), 'is an appropriate finish to an important and, in some respects, unexampled piece of work.' Mr Wragge has been successful in placing at the disposal of the Meteorological Society a valuable series of observations taken on the highest elevation in these isles, and complete for four months; and if the work is to be resumed next season, it is to be hoped means will be granted to insure to the brave observer all the safety and comfort which in the circumstances are practicable.

#### THE WRECK REGISTER FOR 1879-80.

In the offices of the Board of Trade, a Register is kept of all the wrecks and other casualties which may happen around our coasts during the year. The Register for 1879-80 is now published, showing that there were in that period two thousand five hundred and nineteen 'wrecks,' under which term is included every kind of maritime disaster. It is curious to note that the number of wrecks for 1880 is more than double that of 1855; and this increase is only partially accounted for by the fact that during the interval the total tonnage of British shipping has doubled also; the fact being that it was to be expected that improved methods of shipbuilding, and the advance in scientific appliances, would have tended to the increased security of vessels, and consequently of human life. Taking an average of years, the increase is found to be still greater than a mere comparison of the two years 1855 and 1880 brings out. In the five years from 1855 to 1859, the average number of wrecks annually was one thousand two hundred and four; while in the

five years from 1876 to 1880, the average was three thousand four hundred and sixteen. That is, the number of disasters at sea now is treble what it was twenty years ago. The mere increase in the number of ships is not sufficient to account for this great increase; but a significant entry in the Register for 1880 may be held as throwing some light on the question. Out of the two thousand five hundred and nineteen disasters, six hundred and three, or one-fourth of the whole, were due to collisions between vessels; suggesting the suspicion that the haste and hurry attending modern commerce have infected the seafaring classes, and that there is a lack of caution on the part of officers in avoiding collisions during foggy weather, or in entering or leaving port.

In one respect, however, there is cause for congratulation, and that is in the comparatively small number of lives lost by wreckage in 1880. In the eleven hundred and forty-one wrecks of 1855, there were four hundred and six lives lost; while in the two thousand five hundred and nineteen wrecks of 1880, there were only two hundred and thirty-one lives lost. So that, if the destruction to vessels by wreck and otherwise seems to be greatly increased within these twenty years, the reverse process has happily taken place with respect to the lives of sailors and passengers. This pleasant result, so far as our coasts are concerned, is mainly due to the life-boat agencies now in operation. The importance of this means of saving life is most clearly shown when we state that while two hundred and thirty-one lives were lost by wrecks last year, no fewer than two thousand nine hundred and twenty-three lives were saved by the life-boats. We are glad to see, from the Board of Trade Chart, that almost every port on the east coast of England and Scotland is supplied with a life-boat; while on the west coast, and the corresponding shores of Ireland, a large number is also now planted down. There are still many localities where life-boats could be most advantageously placed; and to those who have aided or are aiding in the truly philanthropic objects of the National Life-boat Institution, no more satisfactory proof can be given of the great advantages which that Institution affords to the seafaring community, than the record of lives saved as above.

#### THE STUDY OF DENTAL SURGERY.

The study of dental surgery was for many years left in a most low and unsatisfactory condition, and we are glad to observe that increased attention is now being called to the subject. At last meeting of the International Medical Congress, a paper on *The Study of Dental Surgery*, was read by Mr John Tomes, F.R.S., L.D.S. Eng., &c., which paper has since been issued separately as a pamphlet (London: John Bale & Sons). In the first and second decades of this century, dental practitioners were, says Mr Tomes, few in number, and for the most part members of the medical profession. But the knowledge which these practitioners had of the subject was gleaned in a casual and uncertain way, no special course of study having been then thought necessary to qualify a young doctor or an apothecary's boy to extract teeth, and do the other work of the dental surgeon. After a time it came to be acknowledged among dental practitioners that the system of training—or rather want

of system—was unsatisfactory, and that something more than mere manipulative skill was necessary before the dentist could be held as fully equipped for his profession. In the pamphlet before us, Mr Tomes goes very fully into the details of the curriculum now laid down for dental students, which curriculum should be known to all who look forward to assuming dental surgery as a profession. The consequence of this reform in the teaching of dentistry will also be of advantage to the public, as it secures that those who enter the ranks of the profession shall be duly qualified for the work they have to perform.

#### NOBLE INSTANCE OF SELF-SACRIFICE.

In the daily experiences of life, we so often meet with what is mean and selfish, that we are apt to credit our common humanity with a greater share of bad than of good qualities. It is reassuring, therefore, to find now and again in the diversified chapter of accidents that makes up life, some example of unqualified self-abnegation, of willing self-sacrifice, that is not shaken in its resolution even in sight of death. The following is one of such. The *Cyprian*, commanded by Captain John Alexander Strachan, left Liverpool on Thursday, October 13, for the Mediterranean. Not long after setting out, she encountered a heavy gale, which gradually increased to a perfect hurricane. On the following day, after all her steering-gear had been carried away, and one boiler tube having burst, she became unmanageable, and was driven ashore on the coast of Carnarvonshire. There were on board twenty-eight persons, including one poor lad, a 'stowaway,' who had, as the term implies, managed to conceal himself among the ship's cargo before starting, ready to take whatever reception should be accorded him when discovered by the sailors—that is, if hunger and thirst did not in the meantime drive him to forestall discovery. Before the ship struck, what life-belts were on board were distributed among the crew, one being reserved for Captain Strachan; and one after another, the crew had plunged into the boiling surf, to be hurled by it to the shore, as affording the only chance of saving their lives. The captain remained to the last, and was about to follow the example of the others, when his eye fell for the first time on the poor shivering 'stow-away,' whom terror had driven forth from his hiding-place. But the captain at that moment had no word of anger or blame for the little waif. Taking up the life-belt intended for himself, he fastened it securely round the lad, bidding him leap into the sea; he himself following, but without a life-belt. The poor boy was carried safely to the shore; the noble-hearted man perished. Let us hope there still are in the world, in Addison's phrase, 'troops of heroes' that can thus 'undistinguished die.'

#### THE CHILDREN'S SCRAP-BOOK MISSION.

Now that the long evenings have returned, the Secretary of the above Mission is again asking for pictures, scraps, and cards of all kinds, for the decoration of the Scrap-books which are made up by this agency for the poor children of London. We are informed that more than one thousand Books have been prepared by ladies and children

in all parts of the country, and given away to children in Homes and Hospitals, as also to sick children in the districts of two City missionaries, who have rendered valuable assistance in the distribution of these Books. Ladies with spare time would find pleasant employment in aiding this philanthropic work; and we are sure the Secretary will be glad to enroll the names of any of our readers as workers in the cause, if they will communicate with him at the address of the Mission, 24 Richmond Terrace, Clapham Road, S.W.

#### THE AUTUMN OF LIFE.

THE old man sits at his cottage door,  
In the gleam of the dying day;  
His heart is calm as the silent shore,  
When the winds have passed away;  
His thoughts as still as the fragrant breeze  
That whispers of peace to the azure seas.

His is the beauty of earth and air,  
The glow of the twilight hours;  
He feels that glory everywhere  
Is breathing from woodland flowers;  
And his heart grows young, though his years are old,  
At the wondrous sight of the sunset gold!

For Memory comes with a gentle hand,  
And beareth on Fancy's wings  
His thoughts to her own immortal land,  
Where the Past for ever sings  
Of joys that brightened the fair days fled,  
Ere friendships faded with friends long dead.

And the Past, though sad, for the love that is gone,  
Is sweet to the old man's mind;  
Like the birds that sang in those years, have flown  
The hopes he hath left behind;  
Yet Memory brings from each bygone day  
Some gift of peace for his lonely way!

And the children love that old man dear  
As he sits in the twilight there,  
Listing a music they cannot hear,  
From the sea and the voiceful air;  
And gather around, like glad some flowers,  
As he tells them tales of the vanished hours.

And so the Present is made more bright  
By the lessons the Past hath taught;  
As the East reflects the wondrous light  
Of the West, by sunset brought;  
And though his vision is growing dim,  
God maketh his pathway bright to him.

His age is peace; yet he joys to think  
That a deeper than earth can know  
Shall be his, when his tranquil soul shall drink  
Of a balmy twilight glow,  
In that happier Home, where his thoughts at last  
Shall yearn no more for the distant Past!

## EARTH WORMS.

EVERY one is more or less fully aware of the importance of 'little things;' but few indeed have any adequate conception of the great results effected by the long-continued operation of seemingly insignificant agencies. It is a well-known fact that many of the once famous cities of antiquity have long since disappeared, some of these cities so vast that it is quite impossible the stones of them can have been all removed. Yet where we may have reason to believe that some few centuries ago a city stood, we find to-day a green expanse of pasture-land, with here and there perhaps a few rounded knolls or mounds relieving the flatness of the scene. Turning up the soil beneath us, we probably find a fine black loam, suggestive of a deep rich virgin soil; but digging deeper, we may strike upon the marble plinth of a ruined column, or the tesserae of some old mosaic pavement. The fact that in the course of years great cities are found thus buried many feet below the ground, must often have appeared a mystery to many. We confess to having been frequently puzzled by this strange problem, but without ever obtaining a satisfactory solution of the difficulty till recently; and the explanation was then as unexpected as it possibly could be. Yet, however incredible it may appear, we have it on the trustworthy authority of Darwin that the key to the whole mystery is supplied by the one word, worms; and in his latest work, *The Formation of Vegetable Mould through the Action of Worms, with Observations on their Habits* (London: John Murray), we have abundant proof of the hitherto unrecognised importance of this humble creature.

Forty-four years ago, a paper 'On the Formation of Mould' was read before the Geological Society by Mr Charles Darwin; but so novel were the views expressed in it, that the author's conclusions were received with something like incredulity. Convinced, however, of the truth of what he had written, Mr Darwin determined to investigate the question fully, and so place

his former conclusions beyond the possibility of doubt. Meantime, the world in general had forgotten all about his paper, so that the information contained in the present volume comes upon us almost in the light of a revelation. It is a trite but truthful saying, that people generally know least about the things with which they are most familiar; and this statement receives abundant confirmation from the facts which Darwin brings before us, showing how stupendous is the work accomplished by the agency of worms, and how inadequately the importance of these little creatures in the economy of nature has hitherto been recognised.

In his earlier observations Mr Darwin discovered that small fragments of burnt marl, cinders, &c., which had been strewed over the surface of several meadows, were found after a few years at a depth of some inches below the turf, but still forming an unbroken layer. This apparent sinking of superficial bodies he found was due to the large quantity of fine earth brought up to the surface by worms, in the form of castings, which soon cover up any object left on the surface. He was thus led to the startling conclusion, that all the vegetable mould over the country has passed many times through the intestinal canal of worms; and hence the term 'animal mould' would be more appropriate than the common one of 'vegetable mould.'

After dealing with the subject and the criticisms of his early paper, Mr Darwin goes on to describe the habits and structure of the common earthworm. As every one knows, worms live in holes or burrows in the ground. The interior of these they coat with leaves, to prevent their bodies from coming into contact with the cold damp earth; and as a rule they lie motionless close to the mouth of these holes, so that by looking carefully, one can see their heads quite near the surface of the ground. In winter, however, they completely close the entrance to their holes, and go deeper down, to be beyond the reach of birds or frost, their burrows being often found to penetrate the earth to the depth of even five or six feet. It is

chiefly during the evening and the night, when the earth is moist, that they leave their holes in search of food. They are not at all particular what they feed upon; but such preference as they do exhibit is in favour of cabbage leaves and similar vegetable substances.

The experiments to which Mr Darwin subjected them in order to discover the existence and development of their senses, are particularly interesting. To sound they are absolutely insensible; and not even Orpheus himself could have charmed them with his melodies; for not only did they show the greatest indifference when subjected to the torture of a tin whistle, or the notes of a piano, but even the blast of a bassoon failed to make the slightest impression upon them. With regard to vibrations, however, they manifest extreme sensitiveness; for when the ground is beaten, they will instantly retreat; and if disturbed beneath them, they will quickly crawl out of their holes, probably under the impression that their enemy the mole is after them. This sensitiveness of the worm to vibrations, while unconscious of sounds, was proved by Mr Darwin in a simple and effective manner. Though the tones of the piano did not affect them when separate from it, yet when the pots containing their burrows were placed on the piano itself, the moment any note was struck, the worms instantly disappeared within their burrows. They were thus shown to be sensible of the vibrations, though not of the sounds.

Although destitute of eyes, earthworms are sensitive to intense light; and when the bull's-eye of a lantern is directed upon the creature, it retreats instantly. Their sense of smell, on the other hand, is very limited and weak; for it has been ascertained that not even the odour of tobacco juice or the strong perfume of millefleurs is sufficient to attract their attention; while pieces of cabbage, onions, and raw meat buried in flower-pots near them, did not remain long undiscovered. As already stated, they show a certain preference for particular kinds of food, preferring red cabbage to green, and celery and carrots before either. Of all their senses, however, that of touch, including the perception of vibrations, appears to be the most highly developed.

Regarding their digestive powers, we find they are omnivorous, and drag into their holes anything that appears at all edible, showing no particular objection even to such articles as rose-thorns or splinters of glass. The leaves which they get hold of, they smear over with an alkaline fluid, which partially digests them before they are actually introduced into the body; a fact remarkable as being the only instance recorded of any animal of digestion outside the stomach. But the earthworm does not depend altogether upon meat and leaves for its existence; it finds nourishment in the very soil. Its mouth consists simply of two lips; and as it has no teeth, the particles of sand do not interfere with its mastication, so it goes on swallowing earth, which in its passage through the intestines has all the digestible ingredients thoroughly extracted from it. The indigestible portions are then ejected in the form of little heaps called worm-casts, which every one who lives in the country or possesses a garden

must be quite familiar with. The fine earth brought up to the surface in these little heaps of worm excreta is afterwards spread out by wind and rain more or less uniformly over the ground; the actual weight of these castings thrown up during twelve months being calculated in one case to amount to as much as eighteen and one-eighth tons per acre. Multiplying this by years, we can readily understand how surface objects will soon be covered up, or appear to sink into the ground; and numerous instances are given by Mr Darwin of stones and walls and pavements which have thus been slowly undermined and sunk by worms. Thus we have at any rate one explanation of the hitherto mysterious fact, that the ruins of old cities have been found so far beneath the surface that the soil has been ploughed and reploughed for years without the least suspicion of the existence of the ancient monuments below.

Mr Darwin, in this connection, furnishes a number of striking illustrations of this burying or covering process in regard to fields which a number of years ago were thickly strewn with stones on the surface, and which stones in course of time entirely disappeared. A field near his own residence was ploughed in 1811, and afterwards allowed to remain in pasture; and so thickly covered was the surface with stones, some of them half as large as a child's head, that it was called 'the stony field.' Thirty years afterwards, a cutting was made in the field, when these stones were found to be covered by about two inches of mould, and a man might have ridden a horse from one end of the field to the other without the shoes of the steed striking a single stone. Mr Darwin traces this change entirely to the agency of worms. We would take leave to suggest, however, that perhaps frost has also something to do with this sinking of stones, small and large, into the soil. We all know that frost acts very powerfully on the soil, raising the surface and the stones upon it considerably above their normal level. When the thaw comes, the softer portions of the soil are probably the first to be affected; and as these soften, heavy objects, such as stones, will tend to sink to a lower level than before, and might thus be gradually covered by the surrounding earth. We would not venture, in the face of Mr Darwin's experiments, to withdraw from the worms their share in this transposition of things; yet we would submit that the action of frost is a factor in the change not to be lost sight of.

While, therefore, Mr Darwin regards the earthworm as a preserver of the records of old time, this comparatively humble creature is nevertheless one of the chief agents in the destruction of the land surface of the globe. The rains and the frost act powerfully upon the higher portions of the land; and the glacier and the mountain torrent carry down the materials of the disintegrated rocks; but these when brought down to the lower grounds might remain there for ages longer than they do but for the agency of worms. In the first place the particles of stone and earth which are swallowed by worms are acted on both chemically and mechanically during the process of digestion; then, again, as the old worm burrows collapse and fresh castings are brought to the surface, the whole layer of mould is subjected

to a slow circulation, during which the friction of the particles of earth on one another still further reduces their size. Thus the soil becomes finer and finer; and as the ordinary means of disintegration, namely, running water and the waves of the sea, act with less and less power on rock fragments the smaller they are, we see how great is the assistance which worms lend in the decomposition and disintegration of the soil. The area of cultivable soil is also thus extended, because castings thrown up either during a shower or shortly before rain, are washed down any inclined surface; while during dry weather strong winds blow these little pellets of excreta from one place to another.

There are many other interesting portions of the book which we have not touched upon, but we cannot omit referring to those which treat of the experiments planned and carried out by Mr Darwin with a view to determining whether or not the actions of worms were guided by anything approaching to Intelligence. His chief experiment in this direction had relation to the habit which worms have of plugging up the mouths of their burrows with leaves, bits of paper, feathers, tufts of wool and horse-hair, pebbles, &c. This is one of their strongest instincts, and a worm has been known to drag, with its sucker-like mouth, a stone weighing two ounces over a gravel-walk to the mouth of its burrow. In order to determine the extent of the apparent intelligence displayed in these plugging operations, Mr Darwin observed carefully how worms dragged leaves into their burrows; whether by their tips, or bases, or middle parts. It seemed, he says, 'more especially desirable to do this in the case of plants not natives to our country; for although the habit of dragging leaves into their burrows is undoubtedly instinctive with worms, yet instinct could not tell them how to act in the case of leaves about which their progenitors knew nothing. If, moreover, worms acted solely through instinct or an unvarying inherited impulse, they would draw all kinds of leaves into their burrows in the same manner. If they have no such definite instinct, we might suspect that chance would determine whether the tip, base, or middle was seized. If both these alternatives are excluded, intelligence alone is left; unless the worm in each case first tries many different methods, and follows that alone which proves possible or the most easy; but to act in this manner and to try different methods, makes a near approach to intelligence.'

So argued Mr Darwin with regard to the conclusions that might be drawn from the experiments he was about to make. And this is how he carried out his experiments. First, he offered the worms leaves of various shapes, both of indigenous and exotic species, and the result undoubtedly established the fact that the part of the leaf which the worm seized for the purpose of dragging the whole into its burrow was *not* a matter of chance; and that, in an overwhelming majority of cases, that part of the leaf was seized which would offer least resistance to being drawn into the burrow. After a great number of experiments with leaves of various shapes and sizes—all which experiments supported the above conclusion—Mr Darwin made a further series of experiments by cutting writing-paper into long triangles, short at the base, and offering these to the worms to plug up their

burrows. The result was the same as before; nearly three times as many were drawn in by the apex as by the base. 'We may therefore conclude,' he says, 'that the manner in which the triangles are drawn into the burrows is not a matter of chance.' He further argues that if worms are able to judge, either before or after having drawn an object close to the mouths of their burrows, how best to drag it in, they must acquire some notion of its general shape. This notion, he thinks, they may acquire by their sense of touch, which, as already mentioned, is very fine. Hence, 'if worms have the power of acquiring some notion, however rude, of the shape of an object and of their burrows, as seems to be the case, they deserve to be called intelligent; for they then act in nearly the same manner as would a man under similar circumstances.'

We have said enough, we trust, to interest the reader in the subject, and perhaps induce him to read Mr Darwin's book for himself; and in conclusion we may just briefly sum up the chief purposes the worm fulfils in the economy of nature.

Earthworms we know are valuable as food for birds and fishes; and to worms our thanks are due for assisting to preserve many an ancient monument which has thrown light upon the history of the past. They are ploughers and tillers of the soil, for they are constantly turning it over and loosening it; thus fitting it for seedlings to take root and for roots to penetrate with ease. By their constant labours, the soil is exposed to the improving action of the air and atmospheric agencies; it is enriched by mixture with partially digested leaves and other organic matter dragged into their burrows; and the rain which falls upon the ground sinks deeper through the loosened soil than it might otherwise have done. But their chief work is to sift the finer from the coarser particles, and by their castings to produce a layer of the finest mould, thus proving themselves co-operators with the farmer and the gardener as cultivators and fertilisers of the soil.

Thus in considering all the facts which prove the importance of worms, we may conclude in Mr Darwin's own words: 'It may be doubted whether there are many other animals which have played so important a part in the history of the world as have these lowly organised creatures.'

## THE STORY OF A THUMB-MARK.

### I.

'You'll be sorry for this, uncle!' The speaker was a young man—little more than a lad indeed, to judge by his smooth face, though in figure he was stalwart and well set up. He spoke passionately, as he closed the door and came out. He did not go back to his desk in the counting-house, but passed straight from his uncle's private office to the street, snatching his hat from the wall in the passage as he left.

'Another row with the governor. Mark my words,' said one of the clerks to his neighbour; 'that young fellow will come to no good.'

The 'governor' thus referred to was sole representative and proprietor of the firm of Anthony

Greig & Co., situated in one of our large seaport towns in the west of England. Nearly a hundred men and women were employed in the factory; and the firm's trade-mark, a ship in full sail, was known all the world over on their packages of flour, meal, and biscuits. Greig's biscuits were sucked by babies everywhere, from England to the antipodes, from Shanghai to San Francisco; ladies crumbled Greig's biscuits and dipped them daintily into their wine; sailors smashed Greig's hard bake with their fists; even dogs, horses, and cattle were supplied with specially prepared confections, guaranteed to possess the qualities both of food and medicine.

Young Anthony Greig occupied a desk in his uncle's office amongst the other clerks. He was advancing through all the grades of the business, till he should be judged fit to hold a share in the firm. But young Anthony was by no means so patient as his uncle desired him to be, nor so steady. Twice he had been forced to appeal to his uncle to extricate him from his debts—gambling debts. And old Anthony was not disposed to be a lenient judge of his nephew's faults.

That day, there had been a third and most serious encounter. Young Greig was involved to the extent of about ninety pounds. He had tried in vain to 'do a bill' on his own account; and he was not sufficiently demoralised as yet to take less legitimate means of solving his difficulties. His uncle, however, did not appreciate at its true value the lad's straightforwardness. Flexibility was not one of the old man's characteristics, and he had already warned the young one that he would not help him a third time. The nephew pleaded his case with the utmost importunity; but in vain. 'I gave you fair and serious warning. You have seen fit to disregard it. Do you think that I am as great a fool as you are yourself? If you don't respect my word, at least I will. Go! Go, I say!' he thundered, as the young man hesitated. So that all the clerks, from the manager down to the odd man who went messages, heard the row, as they called it, between the governor and young Mr Anthony.

As for the old man, he hardened his heart, and persuaded himself he had acted for the best. The boy would ruin himself, if allowed to persevere in such courses. Better strike once and for all. But as the day wore on, things presented themselves rather differently to his mind. There was little tenderness in his nature; but his sense of justice told him that, after all, the young fellow had acted, at anyrate, in a straightforward way; he might have done infinitely worse. He wished the lad had not taken so absolutely his command to go, and half persuaded himself he had not meant it—that he only had intended to order him back to his desk. Meanwhile, he busied himself with work; and on his return from the market, remained poring over his ledger—his private ledger—until it was time to close the office.

'I shall stay an hour or two to-night, Mr Sinnott;

you can dismiss when ready. Send James for something for dinner—as usual.'

It was no extraordinary circumstance for Mr Greig to remain late at the office, as this order would indicate. He was a hard worker, like many successful men; and it is hard to say whether such are successful because they work hard, or work hard because they are successful.

At ten o'clock that night, young Anthony entered the sitting-room of his friend Beesley, living in apartments in Harrington Street. He was pale and discomposed. 'I've had a row with the governor, Dick. I can't pay up, and he wouldn't help me. I want you to give me a night's lodging; I can't go home.'

At eight o'clock the next morning, the women who came to sweep out the office, found old Anthony Greig face forward upon his open desk—dead.

## II.

'Miss Grace is in the drawing-room; and says you are to go up, if you please, sir,' said the servant to a black-bearded, rather sprucely attired man, who entered the hall with the air of a frequent visitor.

'Mr Greig in?' he asked, taking off his gloves, and arranging the blue silk handkerchief in his breast-pocket.

'No, sir. Neither Mr Greig nor Mr Anthony hev come in to dinner. Miss Grace doesn't know what *can* have kept them.' The prim little domestic had a way of italicising her speech in a most arbitrary mode.

'Papa must be staying at the office again to-night, Robert; and Tony has not been home; and I'm very glad you have come.'

'So am I,' said the young gentleman thus warmly welcomed. 'And so you have been nursing the cat all afternoon, eh?'

'Well, it isn't a miracle of observation to find that out; Sids certainly does leave a part of her fur wherever she goes.'

The gentleman thus addressed plumed himself somewhat upon his detective-like powers of observation; and the young lady seems to have known this, for she went on to say: 'But I have been reading—perhaps you can also guess what?' and Miss Greig put her hands behind her, inclined her head to one side, and assumed generally a saucy and critical air, whilst her companion peered about. 'Oh, you are quite cold in your search!' she continued. 'It isn't at that side of the room at all.'

'Well, you barely give a fellow a chance, everything is so neatly put away on the shelves. However, I think I have got it. *Sibylle*—isn't that the book in question?'

'How could you guess?'

'Oh, easily enough. It does not need much cleverness to infer that you had been reading a certain book, with a binding very much warped by that intolerable habit of yours of taking a book to the fire and toasting its poor back until it writhes like a martyr at the stake.'

'Books are made to be used. But is this faculty of observation really useful? It makes one feel almost uncomfortable, as if you were an officer of a private inquisition, holding judgment upon everybody around you.'

'If it's useful to any one, it ought to be to me. Permit me to inform you that I am a lawyer—Robert Slater, of the firm of Farrell, Aliman, and Farrell. My head is my only capital—in the economic sense as well as literally—ahem! Now, I think clever guessing comes by practice as much as by gift. If you waste your time over acrostics or chess problems, you will get very smart in solving them. Well, then, clever guessing may prove very useful to one in my position. I could give you dozens of cases successfully defended or supported which turned on a happy inference.—Here is Aunt Margaret.'

Miss Steel had been busy with some household matters, she being housekeeper in her brother-in-law's house. 'What can have kept Anthony till this hour!' she ejaculated; and then perceiving Mr Slater, she shook hands, and sat down.

'Shall you sit up for Mr Greig?' he inquired, as Grace, an hour or so later, shut the piano and extinguished the candles.

'I think not. He prefers that we should not do so.'

'In that case, I must say good-night. It is nearly eleven.'

To be partner in a firm of solicitors of the standing of Farrell & Co., was a great thing for a young man like Slater. He was only four-and-twenty, but looked half-a-dozen years older. Naturally smart and self-confident, his rapid career had in some ways spoiled him. He had been the clever boy of his family, and had been petted and spoiled, as is not unusual in such cases. And yet he was a lovable man.

The Slaters and the Greigs had been neighbours for years, though at present they resided at some distance apart. It was through Anthony Greig's influence that young Slater was introduced to the firm of solicitors of which he had become a member; and between Robert Slater and Grace Greig there was a kind of half-under-tood engagement.

### III.

Mr Slater had business in a neighbouring town the next day. It was past mid-day when he returned; but his intention of going direct to his favourite restaurant—he was the happy possessor of a robust appetite, which renewed itself thrice a day with the regularity of clockwork—was frustrated by an item of news on a broadsheet. The evening papers had bloomed quite prematurely into existence a full hour before the sun had reached the meridian, in their anxiety to tell the story of what was called, in the manner dear to reporters:

'A TERRIBLE TRAGEDY.—A shocking occurrence has happened in our midst. A gentleman known and respected by multitudes of his fellow-townsmen, Mr Anthony Greig, of the firm of Greig & Co., was found this morning dead in his office. The body was discovered early this morning by the women-servants. The dead man was lying forward on the desk in the private office. In the absence of medical testimony, which will be forthcoming at the inquest, conjecture is at fault; but the majority incline to the belief that his death was not due to natural causes.'

'Later.—It is now certain that not apoplexy, as some supposed, but strangulation, was the cause

of Anthony Greig's death. He has also been stabbed; but the wound is not of itself sufficient to have caused death. It was the habit of the deceased occasionally to remain late at the office, and this was the case last evening. We understand that the circumstances point to the supposition that the murder was accomplished between six and nine o'clock last night; but whether the motive of the deed was plunder or revenge, is not as yet evident. So far, nothing has been missed from the cash drawers or the safes, the keys of which were found, apparently untouched, hanging from the lock of the open desk. The doors and windows show no signs of having been forced. The police are making diligent inquiries, and it is said have discovered a clue, the nature of which has not transpired.

The late Mr Greig led a retired life, and his name came but seldom before the public. His death will be sadly felt by a large circle of friends. His career has been one of unceasing and unassuming business energy; and though he took but a small share in the political affairs of his native town, he was amongst the most generous supporters of all local charities. Quite a gloom has been thrown over the town by this tragic occurrence, and this is intensified by certain sinister suspicions, which we refrain even from hinting or mentioning, except for the sake of hoping that they are groundless.'

Thunder-struck by the intelligence, Mr Slater hurried at once to the factory. Things were, to all appearance, going on as usual; that is to say, the machinery was in full action, and the clerks were all present in the office. The managing clerk, Mr Sinnott, an elderly man, painstaking and assiduous, kept things going for the sake of one or two large contracts in execution; but only the necessary current work was being done in the office. Many stood at their desks listless and distraught. A few continued to write the absolutely necessary correspondence, and all that was said was spoken in hushed whispers.

'What is this terrible news, Mr Sinnott?' asked Slater as he entered the office. 'I have been out of town, and have just heard it. Does Miss Greig—Have you sent word to the house? Where is young Mr Anthony?'

Sinnott looked up, and methodically laid down his pen. Then in a whisper: 'Come this way, Mr Slater. Mr Farrell has been here. I sent for you, and he came. This is shocking, is it not?' He led him aside, out of hearing of the others, and proceeded: 'This is a more awful affair than you imagine. Carson the detective has it in hand. There is no doubt of its being a murder, and the worst is, it has been done without breaking locks and without robbery. What does it point to, Mr Robert?'

'Why! that whoever did it, must have been on the premises, I suppose.'

'And took nothing! Perhaps rather it means, that whoever did it, had the means of entering the premises;' and Sinnott, who was fat and comfortable-looking, shivered nervously and coughed.

'You don't mean to say'—began Slater.

'No; I don't say anything. But I'll tell you what others will say. Young Mr Anthony will

be accused of this, as sure as you and I are here. I don't believe it of him. Of course, I can't believe it; but things look very black, very black indeed. Yesterday, they quarrelled on the same old subject. I don't think the amount of Mr Anthony's debts was much; but his uncle seemed to lose temper. We heard very high words when the door opened, and he came out in the most excited manner. The last expression every one in the office heard was: "You'll be sorry for this, uncle;" and off he went. Now, there is his desk just as he left it yesterday, except for one thing. There was a white-handled pocket-knife there then. To-day, it is covered with blood, lying'—Sinnott pointed expressively with his fat forefinger to the inner room.

'Where is Anthony?'

'That's the worst of all. Mr Anthony is missing. Add that to the fact of the quarrel, the threat, the knife, and to the singular fact that nothing has been stolen or violated—and what is the conclusion?'

Mr Slater shook his head ominously, and his looks belied his words as he answered: 'Oh, well; let us hope Anthony can refute all this. It looks bad enough; but we can't say till we have heard his own account of his doings.—Here is Carson now.'

The detective was a tall, blue-eyed, light-bearded man, of about five-and-thirty. He drew himself up with the air of stretching himself, as he held the door and closed it, and then strode leisurely into the office.

'Well, Mr Carson, this is a bad business.'

'It is indeed, sir—as bad a business as I've seen. I suppose your people will take up the case for the young man. I've found him; he'll be at the coroner's court in the morning.'

The three then repaired to the room of the deceased, Carson removing his hat and placing it on a chair. There was a desk in the middle of the room, of the kind called cylinder desks. A few pictures were on the walls; a safe stood behind the desk, its massive iron painted in imitation of walnut; and beside the safe there was a door, seldom used, communicating with the factory.

The most careful search had failed to reveal anything except the white-handled knife, now in safe custody at the police office.

'What do you make of it, Carson?'

'Nothing, sir. There's not a trace to lay hold of, except, maybe, it does look a little queer that the knife should have been forgotten. Seems to me, if I'd ha' done it, I might praps have forgot a handkerchief or a jemmy; but the knife itself would be the last thing to be forgotten. Curious thing, too, is those keys sticking in the desk there. If they have been used to open the safe and take anything'—

'Everything is in order,' put in Sinnott.

'Well, I say if the keys have been used, it must have been by a cool hand, to go and stick the right one in the desk again, as if nothing had happened. It looks precious like suicide, to me.'

'Well, there's nothing more to be done here, I suppose,' said Mr Slater. 'Leave everything as it is, Mr Sinnott. Those things can go back to the restaurant. Poor man, he little thought that this would be his last meal.—Well, let us go.'

'The inquest is to-morrow morning at ten, sir,' said Carson.

'Very well; I shall be there.' So saying, Mr Slater disappeared.

## THE CHINESE IN AMERICA.

WHAT is to be done with the Chinese in the Western States of America? is a question which has for some time been puzzling American statesmen. In San Francisco, the Celestials are thirty thousand strong; and nearly every third person you meet in the streets is a Chinaman, trotting along in his black felt hat, blue linen blouse, awkward-looking shoes, loose white stockings, and inevitable pigtail. Very strong the cry of interested parties: 'John Chinaman must go. He is over-running the country; he is ruining the market; he is quarrelsome, ill-tempered, and dishonest; he is a confirmed gambler, and a slave to opium-smoking; he earns money in America, and takes or sends it back to his own country to spend; his clothes he imports from China, also the rice which is his staple article of diet, and even the opium he smokes. Instead of spending his money in an open, free-handed way, encouraging trade, he lives so frugally, and saves so carefully, that when he returns to his native country—which is the ambition of every Celestial to do—he leaves America so much the poorer for his having been there.' So his enemies say. But this argument does not hold good. They seem to forget that he leaves the country so much the richer for all his patient, careful labour.

But all partisanship is apt to be one-sided, and John's enemies too frequently will refuse to utter a word in his praise. He is altogether a great nuisance to them; he is not wanted, and he must go. Even Sambo—in happy forgetfulness that until very recently *he*, as a freeman, was barely tolerated—even Sambo echoes the pitiless cry: 'Chinaman must go.' But ask the opinion of any disinterested party, and you will hear a very different story. Or ask the thrifty housewife, who will tell you that she can buy her pumpkins, her tomatoes, &c., at the door from John for half the price she has to give to a white man. Or ask those who have employed him as a domestic servant, and they will tell you he is cleanly, industrious, and faithful. He is, in fact, frugal and hard-working, and in the main a quiet and peaceable citizen; and when he does quarrel, it is generally with one of his own fellows.

We confess to a feeling of great sympathy with poor John, who, especially in San Francisco, is often treated both harshly and unjustly. Perhaps, in that not too orderly city, his presence is the most felt; and it is no uncommon thing for him to be wantonly attacked in the street, and mobbed and stoned by the young roughs, men and boys, who abound there, and are known in slang phrase as 'Hoodleums.' There is something pleasant and childlike about his ready, good-humoured laugh, and queer-sounding 'pidgen' English; something quaint and picturesque about his costume, his slim undersized figure, his shaven head, glittering oblique eyes, slender brown hands—adorned in some instances with nails of portentous length—and his unfailing pigtail, whose coarse black hair is cunningly eked out with plaited braid or thread until it appears to reach below his knees.

But then we are not an inhabitant of San Francisco; the father of a family, for instance, who has sons to place in the way of earning their living, and finding great difficulty in doing so, because John is there first. Possibly under these circumstances we might find our sympathy largely tempered by jealousy under the promptings of self-interest. 'They fill up all the places,' an intelligent San Franciscan complained to us; 'until a man like me, with lads to provide for, hardly knows where to turn. A Chinaman will earn seventy-five cents a day, and save out of it, and a white man cannot do it. But then they live upon rice, and their dress costs them next to nothing.'

That John earns seventy-five cents per diem and saves out of it, is true; but is he to blame for this? His tastes are economical, and his living of the simplest. He does not smoke ten-cent cigars, nor drive a 'buggy' in the park on Sundays, as seems to be the approved fashions in San Francisco for young men of all degrees. Besides this, he is not above putting his hand to many kinds of work which the free and independent republican seems to consider derogatory to his dignity, and an infraction of his somewhat obtrusive creed, that he is as good as any man he meets—and rather better. John is the almost universal laundress out West; he is also a barber, a baker, a shopkeeper, a domestic servant, a road-maker, a worker on the railway-line—in short, anything and everything to which he can turn his hand, with apparently not a particle of fear that his dignity will suffer thereby.

John is gregarious, and he and his fellows mostly congregate in their own special quarter of the city, popularly known as Chinatown; and a most interesting tour of inspection can be made there by the visitor, provided he go under the escort of some officer of the law, without whom it would not be safe to venture into some parts of the town. The one who accompanied us—a party of six, who set off one evening about eight o'clock—was armed with a double-barrelled pistol, a six-chambered revolver, and a pocketful of cartridges. But then, as he explained, it was more as a precautionary measure against any white roughs, than from any fear of the more harmless Chinamen.

Chinatown occupies a hilly part of the city, where two or three respectably large, and tolerably well-paved streets slope steeply down, and are crossed and intersected by narrow alleys and court-yards, where dwellings are crowded together, dingy, close, and almost unimaginably dirty. On the right, as you ascend one of these steep streets, stands the *Globe Hotel*, a large and imposing structure, originally intended to serve the purposes of an ordinary hotel, but which has now fallen entirely into the hands of the Chinese, who, crowded together, setting all sanitary laws at defiance, have turned the place into a veritable rookery. It is easy to see, as you walk along the streets of Chinatown, that you are not in an ordinary neighbourhood. It is the exception to meet with a white face. The stores have a curious foreign appearance; and the names over the windows are not such as one usually sees in an English-speaking town—Chin Lee, Sam Lung, Ho Sing, Wang Lo, and so forth.

The better streets boast some really good shops.

At the highest end of one, you can see a corner store, filled with all sorts of tempting native wares—fans, toys, cunningly carved work, and any amount of china nicknacks, teapots, vases, &c. A little below is a silversmith's shop, where silver ornaments, beautifully hand-worked, can be bought for a mere trifle. Next door to this you come upon a goldsmith's store, where several men are busy at work, cutting, carving, inlaying gold-thread; and all with such patient microscopic care, that you almost wonder that the slender brown fingers do not give way, or still more, that the eyesight does not fail. Upon being asked to show some of the finished wares, the master of the store carefully extracted from behind his counter an old cigar-box, from which he drew several articles with jealous care—rings, earrings, brooches, and ornaments for the hair. Upon a small gold ring being selected, he took it, weighed it, charged the ordinary rate at which gold is sold, and added a dollar for the workmanship; which, seeing that the ring was hand-made, and engraved with flowers and dominoes, seemed anything but an extortionate price.

Below this store you enter a barber's shop, where you see one man having his head shaved; another his pigtail replaited; while on the left, one of the operators appears to be shaving the inner part of the eyelids of his customer. It is not a pleasant process to watch, for it makes one shudder at the bare idea of the slightest slip of the razor. But both are apparently quite oblivious of our entrance. The hand of the operator does not shake a hair's-breadth: whilst his patient sits unmoved, nor trembles for his eyesight, confident in the other's skill.

Greengrocery stores, stores for wool and fuel, bakers' and confectioners' stores, cigar and opium stores, abound. On the opposite side, is a large and flourishing restaurant, which we entered, and which was conducted—according to the name over the window—by a certain Mr Bun Sun Low. The ground-floor appeared to be devoted to cooking and confectionery, and everything was temptingly fresh and clean. In the background, two Chinamen were employed over a heap of dark-looking bulbs, which they were peeling and slicing. It is a root indigenous to China, and largely used in their cookery. They hospitably invited us to taste it; and the taste was by no means unpleasant. The inner part was white, and in flavour something between a cocoa and a Brazil nut. Upstairs, we found a large room like the one below, spotlessly clean, painted red, and furnished with carved ebony chairs and tables; exactly in the style so much in vogue in England at the present time. The window opened upon a broad balcony overlooking the street, and lighted by fantastic Chinese lanterns. Mr Bun Sun Low was not long in spreading the table for tea—a clean white cloth, delicate cups and saucers, with large teaspoons of finest china; and two dishes of preserved fruit as accessories. He laughed good-humouredly at the ladies of our party, who insisted upon drinking milk with their tea; and politely instructed our barbarian ignorance in the proper method of making and pouring out his fragrant infusion.

In the street outside, all was still noisy and busy when we once more sallied forth. The people were still going about their various busi-

nesses, men, women, and children; not many women, however, for it is considered a disgrace for a Chinese woman to come over to America, and those you meet are mostly belonging to the poorer and more degraded class. We were told that John finds considerable difficulty in persuading any white woman to marry him, and that hitherto only a few Irishwomen have been prevailed upon to try the experiment. We are almost inclined to wonder at their reluctance; for, we hear, he makes a kind and careful husband, and abstains from intoxicating drinks.

As you pass them in the street, it is not easy to tell the men from the women; for the men are almost without exception beardless, and dress exactly the same; though the women, having, according to Chinese belief, no souls, and therefore not requiring anything by which to pull them up into paradise, do not sport pig-tails, but wear their smooth satiny hair in broad shining braids. They also wear earrings, which, we were informed, a man may not do until he attains to the dignity of grandfatherhood.

To the theatre next, which is open nearly every night, and where plays are acted that drag their slow length through a whole fortnight; a trial of patience, one would suppose, both for actors and audience. On this particular evening, however, there was a 'church benefit,' and the house was crowded to the very doors, so that our party could not even obtain standing-room, and had to be content with a momentary glimpse of one or two fantastic figures in gorgeous dress, promenading and gesticulating upon the tiny stage.

The joss-houses, or Chinese places of worship, are by no means remarkable for their beauty, being generally dark and gloomy, with not the slightest pretension to any artistic design in their construction. Indeed, the joss-image is frequently placed in a dreary room on the first floor of some unpretending house. Sometimes there is more than one—a large bronze joss for the men to worship, and a smaller one for the women. There are always a large bronze bell and a drum, which perform some part in the worship; while a sort of pastile, in the shape of little bundles of wood, is placed in front of the joss, set on fire, and left to smoulder, by way of incense.

In some of the side streets and courts which we explored, the scenes met with almost beggar description. The squalor, the poverty, the filthiness, and the misery of the poor creatures crowded together, were dreadful in the extreme.

But it was in the thieves' quarter where misery, over-crowding, and lack of fresh air found their deepest depth. There you descended a flight of steps, and entered a tiny room, more like a cupboard than anything else, where an elderly man sat at work mending his lamp. Beyond that was another cupboard, untenanted at the time; and when you had gone through that, you came upon a third, where a man sat cross-legged, eating rice out of a basin by means of chop-sticks. The atmosphere of this last room is better imagined than described, for window or ventilation it had none. These men were thieves, who rest during the day, and when night comes, sally out on their predatory excursions.

The regulation supposed to be in force is that each person shall have five hundred cubic feet of air; but that is only in theory; and in many

houses in Chinatown you may see the people packed in bunks two feet six inches high, one above another, three stories in a low room, and all smoking opium. The inspector informed us that a white man is fined if discovered indulging in the practice; but with John, the offence is condoned. It is curious to watch them prepare the precious morsel, placing it carefully at the end of a long pin, warming and twisting it over the flame of the lamp until it is of the proper consistency, and then packing it into the bowl of the pipe with the precision of long practice, to be slowly consumed in a few clouds of thick blue smoke. With some, it will require several of these pipefuls to reduce them to the state of dead sleep in which we saw some men lying.

No doubt, John is a sad slave to this vice of opium-smoking; and besides this, he has another fault, which cannot be passed over without mention. He is a confirmed gambler, and the taste seems to be born with him. It often bears sad fruits for him; as, for example, when he will squander away at some game of chance—usually dominoes—the hoarded earnings of years. One of our friends, crossing from San Francisco to Shanghai, told us of a young Chinaman who had been out for some years, and who, having earned five hundred dollars (one hundred pounds), was returning to his native land to buy a wife—according to Celestial custom—and live on his fortune for the rest of his life. But before the boat reached her destination, the poor foolish fellow had gambled away the entire sum; and in despair, threw himself overboard, and was drowned.

It was midnight when we turned away from Chinatown; and it was a relief to get out into the open street, and leave behind us the unlovely sights and unsavoury odours, the squalor, the dirt, the poverty, and the wretchedness of that most miserable quarter. Beyond, the streets were silent and almost deserted; the cloudless sky was spangled with glittering stars, shining over the sleeping city, the quiet bay, and the distant 'Golden Gate.'

The inspector, walking by our side, expatiated largely upon the wrongs inflicted on the white man by the presence of the Chinese, and re-echoed the cry: 'John must go.' But to say of a people thirty thousand strong that they must go, is one thing, and to make them do it, is another; and the difficult question still remains for the future to solve—What is to be done with John?

## SKETCHES OF SCOTTISH LIFE AND CHARACTER.

### A COUNTRY MINISTER.

A MAN might not necessarily be held up to public ridicule as altogether ignorant of the science of geography, even if he should be compelled to admit, in the course of an examination, that he had never heard of the village of Heatherton. Heatherton is not a large village; it is not even a middle-sized village; and in spite of the railway which has been constructed within these last few years so as to pass at a very short distance from it, it is drifting slowly to decay. It is still, nevertheless, a place of some importance—to its inhabitants. Indeed, it would not surprise the

present writer to learn that by some of these simple souls their slowly decaying, inconsiderable, out-of-the-way country village is held to be the very centre of the universe. To some of them, at any rate, its good name and fame are very precious, and there are little episodes in its history to which they never refer; or if they do refer to them by any chance, it is with a degree of hesitation and an amount of unwillingness very obvious to an inquirer armed with some previous knowledge otherwise obtained. At the present time, for instance, when the ecclesiastical chronology of the place is in any way brought into conversation, it does not seem singular to the younger generation to hear it stated confidently that the Rev. John French was succeeded in the ministry by the Rev. John Robertson, and so on, without a break, down to the present much respected pastor. Fifty years ago it was different, and it required some explanation—very difficult to be obtained, however—as to how the spiritual wants of the congregation were ministered to during the three years that intervened between the sudden passing away of worthy Mr French (which event we noted in our sketch of Puir Miss French) and the settlement in Heatherton of Mr Robertson.

Shortly after the sudden and unexpected death of Mr French, the choice of the congregation fell with singular unanimity, and even cordiality, on a young man of great promise and remarkably good looks, the Rev. Henry Youatt. He seemed, and probably was, about twenty-five years of age when he came to Heatherton; but although he had only obtained his probationer's licence a few months before, he came recommended by so many pious and influential ministers by whom he had been known, that we might well flatter ourselves our choice had not been misdirected. For some time after his ordination and induction into the pastorate, it seemed as if his stay among us was likely to be of the shortest; and indeed, we could hardly hope that a young man endowed with the gifts and graces possessed by Mr Youatt could for long escape the prying eyes of congregations with much more of worldly temptation and advantage at their disposal than we could ever pretend to offer. But it was from the mere fact that for some months after being 'placed' he made no effort to settle among us, coming from somewhere every Saturday, and going away as vaguely on Monday morning, that we argued thus early a short term for his ministry amongst us.

This was—and we all felt it to be so—an eminently unsatisfactory state of affairs. James, more frequently called Jeames, Monk, the dooce and much respected, as well as wise and witty ruling elder, had been heard to declare that this would never do. This had been repeated with every degree of emphasis by the whole congregation, down to auld Kirsty Baird, who in spite, or probably in consequence of her deafness, took her seat every Sunday on the pulpit stairs, where she made audible comments from the voluminous folds of her scarlet cloak on such portion of the sermon as seemed to reach her brain.

It was determined, therefore, to appeal to Mr Youatt for some information as to when he intended to take up his residence in the manse, which had cost a considerable sum to the parish, and was gaining nothing by standing unoccupied. To the deputation of elders who waited on

him, Mr Youatt was all frankness; but while professing his willingness, nay, anxiety to live in our midst, declared himself entirely unprepared to take up his abode, single man as he was, and with no immediate intention of getting married, in such a huge caravanserai as the Auld Loan Manse. It was, he said, equally preposterous to expect him to wander from door to door up and down Heatherton in search of a lodging; he, a minister, and not yet personally acquainted with many of his flock, might in such a quest fall into quaint or even mortifying mistakes. But if the deputation would be good enough to take the trouble to find him fitting lodgings, he declared himself willing to be bound by their choice; and when opportunity offered, the manse and glebe might be managed by the same deputation, so as to bring in whatever might be possible, for the benefit alike of minister and flock. Jeames Monk, by position and nature head and spokesman of the deputation, was a man possessed of a fine vein of humour; and such an opportunity as this for taking sly hits at our young, good-looking, and unmarried minister was not likely to be thrown away. The minister, on his part, took Jeames's banter in excellent form, tossing back what he could with a shy, bashful grace and good-nature, extremely captivating to the kindly, unsophisticated, rustic heart. In the end, the deputation did their share of what they undertook to do with exemplary care and diligence; as a consequence of which, Mr Youatt was in a few weeks installed, almost as comfortably as he could possibly have been in the manse, under the roof of the sadly afflicted, but still brave and even cheerful Widow Garroway.

Widow, or, as she was more commonly called, Lady, Garroway was an active little woman of not less than fifty-five years, and it might be a trifle over. Her title of 'Lady' was due to the fact that the house in which she lived, with one or two other houses, were her own property—just as we call a male owner of property a lord or 'laird.' To her husband, who had now been four or five years dead, she had brought four children, of whom only the eldest and the youngest were still alive. Of this eldest son, little had been heard and nothing at all seen in Heatherton for a great many years, he having entered at a very early age into some commercial relations with the 'golden South Americas,' which detained him in that quarter of the globe, until completely shattered health had sent him back, but not to Heatherton. The south of England—almost as distant from us as his former dwelling-place—his doctors pointed out to him as the most likely place in which to recruit his wasted frame; and in the south of England he accordingly took up his abode. After seeing him fairly established in his new home, his mother returned to her own cares and duties, leaving behind her as nurse and companion to her ailing brother, her youngest child, Maggie, a girl at that time of seventeen summers.

Lady Garroway was much too clear-sighted a woman to deceive herself with the belief that any place or clime could lengthen to any great extent the years of her first-born and only surviving son; but what she suffered from this knowledge, she suffered in secret, and still faced the world with such silent heroism of endurance as made

her very generally and tenderly respected. Had we not all sympathised, each as his nature permitted, with the happy mother, when her two younger sons were in one day ordained to preach the Word, and were sent forth from our own village kirk to carry the glad tidings to heathens yearning for the light? Either, or both, might have had comfortable manes and Christian flocks at home; but they had made up their minds, and as missionaries they went forth—to perish. In a short time—so short that it almost seemed as if famine had been in the land of his sojourn—word came that David, his mother's favourite, had fallen a victim to the barbarity of the natives. The mother's eyes had not ceased shedding floods of secret tears for this first 'vacant chair,' when news was brought that Robert had gone down with the wreck of the ship that was carrying him to Madagascar. Old Mr Garroway, framed of less stubborn material than his much more fragile-looking helpmeet, sickened under this double blow, and died in less than twelve months after the last of his two younger sons. Could we help pitying a woman who had had such a load of troubles to bear? or admiring one who bore them so bravely, so silently, and with such pious resignation? Here, now, was the last of her three sons sunning himself for a few brief days in a southern watering-place, before laying himself down to rest for ever; and yet the mother bore herself as only a brave woman could, doing her duty with the old regularity, the old unselfishness, and the same high sense as before of being 'ever in the Great Taskmaster's eye.' It was said—with what truth it were hard to tell—that she felt very keenly the absence of her pretty, blue-eyed, golden-haired daughter Maggie—Maggie, who was to her as the light of her life and as the apple of her eye; but this trouble she also bore uncomplainingly.

It was in profound compassion for her loneliness, and with no thought of worldly gain, that Jeames Monk proposed to his colleagues that advances should be made to Lady Garroway with a view to her accepting as a lodger, with a motherly eye to his temporal well-being, our young and pleasant, but somewhat bashful minister, the Rev. Henry Youatt. To the surprise of many, if not of all, she fell in with the proposals of doudce Jeames Monk with an alacrity that the most sanguine of the committee had not ventured to anticipate.

When the necessary terms and dates were fixed, she set about the arrangements for her new lodger's reception with all her former vigour and practical knowledge of household economy. Her crowning triumph in this direction was achieved in the selection and fitting-up of what was to be the young minister's study. This she converted, out of a large and somewhat awkward closet, into a really pretty if small room; but above all, looking out into a garden which for its size would bear favourable comparison with Laird Lindsay's, and was the wonder of the village and many miles around. When completed, the curious were for a few days permitted to look at this semi-sacred chamber; and many a rustic gazed with awe into what was to be the manufactory of the sermons under which he was for some time destined to sit. Into this study, Lady Garroway conveyed out of the parlour bookcases all of their contents

that could by possibility be construed as bearing on the sacred calling of her lodger. Others she brought, not because they were religious, but because they were beyond her own comprehension, being in learned languages, and the property of her dead sons.

When Mr Youatt actually settled down in our midst, we were quickly satisfied of what was only suspected before, that this minister belonged to a class from which very few of the Scotch ministers of our humble acquaintance were recruited—the class of gentlemen. Mr Youatt was not merely one of ourselves, with a more or less thickly-laid-on lacker of learning, but was one who bore about with him all the graces and advantages of good birth and high breeding. Some weeks after his settlement in the house of Lady Garroway, two stately ladies visited him, with intent, as it would seem, to pass sentence of approval or condemnation on lodging and landlady. These two ladies—one old, the other young, both with bearing and manners to frighten and subdue the average Heather-tonian—could find no word of approval too intense for quiet little Lady Garroway and her belongings. She showed them over her house with the fine courtesy of the little lady she was, and with the innocent pride of the managing woman and careful housewife she was equally well known to be. Genuine exclamations of pure pleasure and surprise broke from them, as the village widow displayed her shelves of snow-white napery 'with sprigs of summer laid between the folds;' and there was no falling-off in their admiration till her duties as show-woman ended at the bottom of her trimly kept and unique garden.

The two ladies went away, therefore, content as it would seem, to leave the gentle young minister in such good hands. Not long after, it began to be whispered about that the elder was the mother, the younger the affianced bride of Mr Youatt. Whether this was or was not the case, no one seemed to know for certain; but it was not a matter to concern any among us very nearly, so no one could make excuse to ask the question either of Lady Garroway or her lodger. These rumours very soon ceased to float about as rumours; but doubtless they settled down as more or less well-founded scraps of information in the popular mind. Other doings took their turn as themes of village gossip; and before many months, Mr Youatt's name was in the general mouth, rivalling in a measure no less a person than Laird Lindsay himself.

Laird Lindsay was not of the real old stock of the village lairds and lords of the manor, having amassed his fortune in the sufficiently unheroic business of school-keeping and the authorship of school-books. Although he had obtained his property by comparatively recent purchase, he was a man of an overbearing disposition, and with sufficient power to make us feel his tyranny acutely. In a dispute which had arisen between us and the Laird as to certain rights of common which seemed secured to us by immemorial custom, the Laird had beaten us outright and punished us heavily. This was before the coming of Mr Youatt. Now, however, he laid claim to the village school; dismissed the schoolmaster with scant ceremony; placed a nominee of his own in the situation; and made changes in the

system of education as hitherto carried on, absolutely startling to the village mind from their suddenness, extent, and, as many were disposed to think, absurdity.

At an open-air 'mote' held at this time to consider what steps should be taken in this new emergency, the shadow of our defeat lay heavily upon us. Those who had been our bravest in that fierce struggle were evidently cowed before a blow had been struck in this; and there cannot be a doubt that the school would have been surrendered to the tender mercies of Laird Lindsay without further parley, but for the gallant part assumed at the critical moment, without noise or bravado, by our young minister. In his hands we felt our rights and privileges safe. That our confidence was not misplaced was abundantly proved by the fact, that in less than six months Laird Lindsay was totally routed, his nominee sent adrift, and our own worthy old friend, Dominie Purvis, reinstalled in his former position. To render the service more valuable still, Mr Youatt took all this upon himself, without causing us one penny of expense; and when the school-room was once more handed over to us, a small debt that had accumulated on it some years before, was also found to have been silently discharged by the generous young minister. If anything was likely to add to a popularity earned by such a public service as this, Mr Youatt was found to be capable of that also. After the affair of the school, it was pretty confidently predicted that the minister would now be as ready to interfere, and probably as hard to bear, as the Laird himself; that from a respectable elementary school, such as was at the time common enough in Scotland, it was likely to degenerate, under the influence of this clever minister, into something between an old-fashioned dame's, and a new-fashioned Sunday school. Nothing of the kind ever happened. Mr Youatt scorned to take advantage of the service he had rendered to the whole community, to exalt either his cloth or his creed at the expense of those who were neither ministers nor seceders. His duties as one of the trustees (*ex officio*) were fulfilled with a strict regard to the letter of the founder's instructions, and rather with a modest deference than otherwise to the opinions of his co-trustees.

His appearance on the 'green' was a phenomenon new to Heatherton; and the less new it became, it grew to be the more welcome. Himself a practised and skilful athlete, his presence at and interest in our village evening sports gave them a value and importance in our eyes they certainly did not formerly possess. It was probably in his speedy total suppression of the almost ceaseless quarrelling and fighting among the young gymnasts, that his value in this quarter was most thoroughly felt, and highly appreciated by the rest of the community. If, as was pretty broadly hinted, this was not effected without an exhibition of carnal skill on his own part that very effectually astonished the most flagrant transgressors, his services in that respect lost none of their value in our eyes.

It was on the 'green,' and while we were secretly deliberating as to the form a testimonial should assume which we felt constrained to present to him, that the crown and seal were set on his great public services. While the burn was in

'spate,' and roaring to the top of its highest bank, a child fell into the turbid flood, and was being rapidly carried downwards. Mr Youatt did not stop to consider what the consequences might be to himself, heated as he was with violent athletic exercise; he did not even stop—as was very pertinently remarked afterwards—to consider that it was the child of the one man in all Heatherton who scoffed at ministers and their work, whose life was in imminent peril; he boldly plunged in, and gallantly succeeded in rescuing the child. We were bound to admire his spirit and pluck; and in little more than one short year after he came amongst us, he received at our hands a public banquet to commemorate that among other things, and to solemnly indorse, as it were, his wide and well-deserved popularity. Whether anything resulted from his sudden immersion, is not very well assured; but about this time, it was observed that Mr Youatt began to have a look of unhappiness quite foreign to him. It was also observed that the hardened weaver whose child he had rescued became a great favourite with Mr Youatt, without, however, making any appreciable change for the better in his attendance at kirk or chapel.

When the minister was at his busiest in the controversy with Laird Lindsay, news reached Lady Garroway, his landlady—or mother, as he had got quite naturally long ago to call her—that her last surviving son was not likely to be any more gladdened by a sight of her, unless she came to him now, and with no loss of time. This news, or something like it—perhaps not quite so urgent—had been for some time expected by the brave little woman; but not the less was she quite prepared to leave her lodger to his own resources, with no attendance save the little maid, for the indefinite time it might all to her to be absent. But he—not for a moment would he listen to excuse or talk of further, or indeed of any hired help; she should go, and go at once; take the little maid with her, for her own personal convenience, and leave him to what he called his own 'devious courses.' And so it was ultimately arranged. But as luck would have it, for the greatest part of the week of Lady Garroway's return from the funeral of her son—whose bedside she just reached in time to close his eyes—Mr Youatt was to be in attendance in Edinburgh, waiting for the decision, and helping with local information, in the great case of Lindsay *versus* The Trustees of Heatherton School. So it came that his landlady was not missed by him while she was away.

On returning from Edinburgh, the duty—never omitted by him—of noticing with a few words of kindly greeting the little maid who opened the door for him, was gone through with something of more solemnity than usual, on account of the mourning which she now wore. From her he passed into the parlour, to offer what he could of sympathetic condolence to his sorely stricken friend. But it was not Lady Garroway who was here to receive him. It was Maggie. He felt it like the flash of an inspiration. Her name was familiar to him, from her mother's oft-repeated, half-involuntary allusions to her 'one ewe lamb;' but his wildest dreams never brought before his mind's eye such a Maggie as this. This was a lady—he needed but one glance to satisfy himself of that—a lady, too,

of such grace of form and beauty of feature as it had scarcely ever fallen to his lot to see united in one person. He was at first taken by surprise; but was soon reassured by the composure of the lady as she introduced herself, which she did, by saying simply: 'I am Maggie.' On this, he also introduced himself; and a little later on, when Lady Garroway made her appearance, she found her children—as she was pleased to call them—enjoying each other's society with the ease and confidence of old friends. The remainder of the day was spent in the company of the mother and her daughter. But when Mr Youatt retired for the night, and was seated in the privacy of his own room, he was compelled to admit to himself that a new and powerful element had that day been introduced into his life—an element of such potential force, that if not at once eliminated, threatened to make shipwreck of his hopes, and drive him he knew not whither.

For although he had not wooed, he had won the stately lady who, as we have already intimated, had once visited him along with his mother; had asked and obtained the promise of her hand; and was bound by all laws of honour at least, to implement his plighted troth. For the wooing, that other stately and strong-willed lady had taken pains to relieve her son of that trouble, and he, with a heart untouched, had a strong desire to do his mother's pleasure. But here was danger of a serious complication; and he felt as if misery was to be his only possible portion henceforth. To-morrow, he said to himself with a sigh, he should break it as gently as he could to kindly little Lady Garroway, that he must go away from under her roof, grown almost sacred to him—away from her own tender, loving, motherly care; away—but this he would not say to Lady Garroway, only to himself—out of the power of her daughter's golden hair and winking eyes, and speech of silver sound—away from all these things, never to come back again. When he had fairly resolved that this was his only safe course, he retired for the night. Now, Mr Youatt was an athlete, with unimpaired digestion, and with him to go to bed meant to go to sleep. But this night his sleep was troubled, and he dreamed. He dreamed more than once or twice that the cold and stately young lady came to his bedside with a colder face and a statelier mien than ever, and reproached him, in tones of icy coldness, with meditated deceit, and treachery and wrong. This was not a very pleasant or restful night for him; but it wore away, and morning came; and many mornings came and went, yet the gentle breaking to Lady Garroway had never taken place, and still he sunned himself in the light of her daughter's beauty. At length a day came when, in consequence of some heedless words in one of his letters, the two stately ladies came to visit him once again. There were few exclamations of pleasant surprise on this occasion, however; and the elder lady determined to deliver her son from temptation by the most summary process known to her—his almost immediate marriage with the object of her choice.

'It will never do, my dear,' she said to the stately young lady, 'to leave Henry to the mercy of this young person, who is really pretty in her own way, and may be designing, in the way common to all her class. We will arrange to have

the marriage solemnised here, and with as little delay as possible; and when you are both settled in the manse, all danger will be past, as well as a very heavy responsibility off my hands.' And straightway she sought the study of her son.

His mind at this moment was actually busy with the same subject as his mother's, but not, it must be confessed, full of the same calm confidence as to the result. He had half resolved to kneel down at his mother's feet, to tell her that he could never marry this woman of her choice, and to beg to be relieved of a burden that had now become impossible for him to bear with happiness or honour. But her very first words froze anew the current of his speech, and he heard what she had to say with the calmness of a man who recognises in what he hears, or sees, the overmastering will of Fate. He heard her to the end, as if her story related to some one altogether distinct from himself; and he caught himself repeating the day mentioned by his mother as that fixed by herself for his marriage, as if it were the date of some historical event he was anxious to impress on his memory. When she rose to go, he rose also, but spoke no word of affirmation, protest, or dissent.

On the following day, the two ladies returned to their home, leaving him for a short time free to follow what in happier times he was wont to call his 'devious courses.' And now, at last, he did what it was his duty to have done many months before, or else to have withdrawn himself where the necessity for doing it at all could never have arisen—he poured out his almost bursting heart before Maggie Garroway. He told her all, without drawback or reservation; and took whatever of comfort he could gather from the confession that in the process was also wrung from her. When the Sunday morning came, and Maggie Garroway went to the kirk side by side with the Rev. Henry Youatt, as had been their invariable custom since her coming home, do you think that any one of all the church-goers who looked on their quiet handsome faces, could have guessed what molten seas of passion were slumbering underneath? It is not likely, or, to that keen observer, I am afraid the Rev. Henry's sermon—good and eloquent as it really was—would have carried lessons far other and deeper than those intended by the preacher.

Before another Sunday came round, it was known to all the parish that the following Wednesday was to be Mr Youatt's wedding-day. On that Sunday morning, for the first time since his arrival, he allowed himself to be somewhat behind his usual time. Douce Jeames Monk made some humorous remark on this as on every other occasion, and threatened in a few minutes to 'go up the Loan and fetch him by the lug.' Jeames did certainly go, as promised, 'up the Loan;' but truth compels me to state that he did not bring Mr Youatt back 'by the lug,' nor otherwise. He found the Lady Garroway and her little maid wringing their hands in an agony of despair at the mysterious disappearance of the minister and Maggie.

The pawky Jeames put off little time in the house of Lady Garroway; he was a keen-eyed old fellow, this ruling elder, and took in the whole story at a glance. He went back by himself 'down the Loan' to the kirk, held short consultation with his brother office-bearers, then climbed

into the lower pulpit, dispossessing from his seat the precentor. Here he read a chapter to the wondering congregation, extemporised, to the best of his ability, a prayer, not deficient in length or fervour, and dismissed them.

The wild rumours and surmises that had spread on the disappearance of Mr Youatt and Maggie Garroway had almost had time to become historical, before a printed paper, affixed to the kirk door, revived them afresh in all their pristine absurdity. This was an extract from the proceedings of the Synod, and merely set forth that at the late meeting of that body, on the motion of Thomas Asterisk, minister, seconded by John Blank, elder, the Rev. Henry Youatt, late minister of Heatherton, had been deposed from the holy office of the ministry.

A party, which fortunately turned out more noisy than numerous, clamoured fiercely for a time against this decision of the Synod, as being high-handed and tyrannical, and wholly unwarranted by anything in the character or conduct of Mr Youatt. They pointed out that some English lawyer whose name I have forgotten—it was probably all a pure invention—had, when a young man, run away with the lady who became his wife, which did not stand in the way of his eventually becoming Lord High Chancellor. This may or may not have been the case; but as Mr Youatt himself took no steps in the matter, his noisy friends soon dropped into silence, and it became possible after a while to draw a decent veil over the whole transaction.

After some years, Mrs Youatt appeared again in Heatherton, more beautiful, if possible, as matron than even she had been as maid, and bringing with her, of all persons in the world, the little servant-girl, a full-grown woman now, who had mysteriously disappeared on the afternoon of the very same Sunday as Mrs Youatt herself. The latter eventually nursed her mother, old Lady Garroway, through the many weeks of illness that terminated in her death. Douce Jeames Monk attended the funeral, and walked from the house to the graveyard and back again with a grand, foreign-looking gentleman, fearfully and wonderfully bearded. The shy old elder was never heard to mention any names; but as he proceeded to manage for the new owner all the heritable property left by the deceased, shrewd guesses were not wanting. At length the Elder, contrary to his usual custom, dropped a letter into the Heatherton post-office. The old post-mistress was unable to decipher the name of the foreign town to which it was addressed; but she was prepared to take her oath as to the person, and that his name was Henry Youatt, Esquire. I do not know whether this was considered satisfactory; but it was all the general public of Heatherton ever learned of their deposed minister.

### OUR BLIND FRIENDS.

It has been the writer's privilege for many years to have had frequent and intimate intercourse with a pretty large circle of our blind fellow-countrymen. And as his experiences have been of a somewhat interesting character to himself, perhaps the reader may desire to be made acquainted with a few of them.

It is unnecessary to offer many general remarks

on blindness. All are more or less impressed with the innumerable blessings enjoyed through the possession of sight, and what a calamity the deprivation of it would be to us. When we consider not only the amount of knowledge and enjoyment derived from its unimpaired possession, but how, to the vast majority of the human race, its very possession is a necessity of mere living, we can perhaps more fully understand the seriousness of its loss. As with most of the thousand-and-one forms of physical suffering, all classes and conditions of mankind find that it is no respecter of persons. Yet it is undeniable that with certain classes, particular kinds of suffering predominate. It is so with blindness. How common it is, from the accidents of their circumstances, for the respectable and struggling poor to be afflicted in this respect; and it is only those to any extent acquainted with these circumstances, who can understand their difficulties and hardships, when so afflicted. It occasionally happens, in the case of a poor man losing his sight, whether by accident or disease, that for months his mind is depressed and almost overwhelmed at the prospect before him; and especially is this the case with those having others dependent on them; yet, notwithstanding this, such is the wonderful elasticity of the human mind, as a general rule, under this form of suffering, as under lighter forms, that it can eventually throw off its temporary depression and lethargy, and, like a summer sky after the thunderstorm has passed, resume its brightness and serenity.

The blind have the reputation of being noted for their general cheerfulness and patience; and deservedly so. On many of their faces may be remarked the habitual smile. Indeed, it almost seems as if the smile had become stereotyped. This is at least indicative of a fair share of contentment and happiness, which is as much as their seeing brethren can possibly expect to attain. They are also in general humorous, have a keen sense of the ludicrous, and are ever ready for a laugh, if you are willing to indulge them, or are willing to be indulged. In the virtue of patience, they are often far ahead of sighted mortals. This is manifested in various ways. Indeed, there is no other class in whom the exercise of this virtue is in more constant demand. As a class, they are to a large extent isolated from their fellows. We have observed them on a fine afternoon standing for hours near some busy thoroughfare of the city, immovable as statues, and listening to the traffic surging past. This is often how they enjoy the sun and air of heaven. But if any of their seeing neighbours will only ask them for a walk into the country, there are none fonder of walking and company than the blind.

We have briefly indicated one or two phases of character in which the blind, shall we say, excel their seeing fellows; but there is another which may be referred to, and that is memory. We have had experience of some curious instances; such as, of a man repeating almost word for word any sermon he might hear in church; another repeating chapter after chapter from one of Scott's novels, after hearing it read; and of another, a decided poet in his own eyes, if the expression may be pardoned, composing verses innumerable

during the night in bed, and retaining them in his mind until he could get some one with sufficient patience to write them down. Another man we know accomplished a feat of memory which we think deserves to be recorded. It is sometimes maintained by those who are hostile to the Shorter Catechism being taught in our public schools, that few remember or could repeat much of its contents after having reached the years of maturity. One day this argument was brought against it in the presence of a blind man whose age would be at least fifty. He at once questioned this statement; and after a few words, the blind man and his friends agreed to meet next day and put his assertion to the test, namely, that he would repeat the Catechism from beginning to end without a mistake, if they would forfeit a certain small sum of money in the event of his doing so. The blind man, like themselves, had given little attention to the Catechism since leaving school as a boy; but he had good faith in the strength of his memory. He accordingly set about his task at home by getting it read over a few times; and next day fulfilled the bargain, to the entire satisfaction of his friends. A fifth man has a wonderful memory for dates, &c., and also seems to have an inexhaustible fund of humorous stories, principally Scotch, and to have a special knack of telling them too.

We may here refer to the subject of dreams as having some connection with memory, inasmuch as the former are largely dependent on the latter. Our blind friends have their dreams; but they are different from the dreams of their seeing friends in one important respect. They are known as *blind dreams*. To the uninitiated, this expression may require some little explanation. Suppose by some accident a man loses his sight. For a considerable time after, his dreams are the same as heretofore. He sees in his dreams the loved faces and the familiar scenes on which his eyes were wont to rest, unchanged. By-and-by, this is altered. Gradually, these impressions fade, and a time comes when his very dreams are *blind*. Gone are the loved faces and places, and he sees them no more in this world.

It has often been remarked with what confidence, and even boldness, the blind will venture alone through the busiest streets of our large cities, and how few are the accidents that befall them. We have heard the expression that a special providence protects drunk men and children; and the blind may be included. No doubt, their safety from accidents to a great extent is due to that confidence, combined with their acuteness in hearing and detecting the sounds of danger. But it need scarcely be said that accidents do occur, sometimes of a serious, but oftener of a humorous character; of the former, even involving the loss of life; but happily very serious results are the exception. Frequently the escapes are remarkable, one or two instances of which may be given. We knew of a blind man walking right into the open grating beneath a shopkeeper's window, falling a depth of about twelve feet, and being lifted out none the worse. Of another who walked into the unprotected foundation of a building; and when the alarmed spectators ran forward and looked down, he was seen coolly groping about for the small bundle he was carrying when he fell.

A desperate struggle for life once overtook a blind man under painful circumstances. One winter's day he had been a short distance into the country, and was returning to the city at night, and alone. He thought he was sure of the road, and all unconscious of danger, held on his way. But unfortunately as it turned out, he had diverged from his road, and ere long went plunging headlong into the canal. Here was a situation for a blind man. But this in itself would have been a comparatively small matter to him, as he was an ordinary good swimmer, and could have scrambled out without much difficulty. But what was his horror, having tried both banks, to find that he was inclosed between solid stone parapets. Vainly he tried, by stretching his arm to its utmost, to discover the height. To no purpose did he swim about. He now felt he was getting exhausted, and determined to make a final effort, if his life was to be saved. Swimming with all his might to the opposite parapet, on the first touch of the wall he made a spring from the water, in the hope that he might clutch the edge of the masonry, and draw himself up. He fell back into the cold water almost hopeless. Recovering himself, he again made the attempt, and again failed. But, like a hero, he made one more supreme effort, and the third time succeeded.

We here think it might not be out of place to refer to a few of the ludicrous accidents that occasionally occur, and which none enjoy and speak of more than the blind themselves. A large and heavy ox was being driven through one of our streets. The poor brute had evidently travelled a long way, and was much fatigued. At length it could go no farther, staggered forward and fell on the pavement, and there it lay. All unconscious of the misfortune of the ox, on came a blind man with head in the air, and smoking his pipe. The few people who were about did not observe the man's approach till he fell prostrate over the broad back of the ox. No sooner was he down, than with a cry of terror he scrambled up, and started back some distance. The people speedily explained to him the cause of his alarm; and were not a little amused at the reply he made, that when he felt the broad, warm, hairy mass, he could not for his life conceive what it was.

Another blind man we saw walking bang against a man reading a poster on the wall, with a basket of two hundred eggs nicely balanced on his head. It is needless to say that the man and the eggs were the sufferers. And so did a baker and his bread come to grief in the same manner. No doubt, these accidents are very serious to the parties immediately concerned; but we can scarcely be blamed in thinking they have also a ludicrous aspect.

There is a certain class of Scotchwomen who are adepts at making black puddings. One of these had been going home with a large tin can of sheep's blood for that purpose. On reaching the iron railings, on her way, of one of our large accidents hospitals, just at the gate she put down her can on the pavement, prompted, no doubt, to take a rest, and also that she might gratify her curiosity by having a peep through the hospital railings. Of course, on came the inevitable blind man, like her Nemesis, and upset the blood on the pavement, and all unconscious of the serious mis-

lap, passed on his way. About half an hour afterwards, we had occasion to repass that way, and found an old Irishwoman gazing at the sheep's blood, raising her hands, and otherwise expending a great amount of sympathy, under the delusion that some fellow-creature had met with a fearful accident, and had just been conveyed to the hospital.

Much pleasanter is the following incident. In one of our institutions for the Blind, a party of visitors were being conducted through the industrial departments by one of the blind men; and as is usual with visitors, they were lavish in their praises of their industry and cleverness. One of them rather extravagantly remarking that they could do anything—to this the blind man, with grim humour, replied, that there was one thing at least in which they signally failed, namely, landscape painting.

Our next story, unfortunately does not present our blind friends in quite so innocent a light. Three men, two of them blind, were drinking together one night in the room of a public-house, and as is too often the result of such convivial meetings, one of the blind men quarrelled and came to blows with the man who could see. Here was likely to be a battle, not by any means on equal terms. But the other blind man was equal to the occasion. That the man who could see should have no undue advantage over his less fortunate opponent, up jumped the blind friend and turned off the gas; and so they pommelled each other in a harmless way for a time.

We have given an illustration of the warlike passion; as an offset, we could give many illustrations of that gentler passion love, for the blind are eminent disciples of Cupid and Hymen. As a rule, a respectable blind man has no difficulty in getting a seeing wife, and very often with good looks to boot. And when we consider the delicacy of touch in the finger-tips of the blind, the latter is not to be wondered at. Blind men, however, do not always marry wives who see. We know of many instances in which both husband and wife are blind, and have managed to rear families without the occurrence of any serious mishap either to themselves or the children. And the cases are rare in which the latter are defective in sight. Only lately, the marriage took place of a blind couple somewhat advanced in years, she being his second wife, and he her third blind husband. The marriage was not wanting in the elements of romance, for in their young days they had courted, and parted, blind in a double sense.

We will conclude with a courtship, but in this case will not vouch for its truth. A blind man on several occasions met a widow, who was not, however, like himself, blind, and latterly concluded that she would make him a good wife. He resolved that he would 'pop the question' without loss of time. Accordingly, one evening found him in the widow's house for that purpose, when his suit was entirely successful. But so elated was he with his success, that on leaving her door, he forgot he was up a flight of stairs. The staircase window being very low, and happening to be open, he felt the air on his heated brow, and at once stepped out without thinking where he was, and so fell into the court below. The widow hearing the noise, ran down greatly alarmed; but was

fully reassured that no bones were broken, by his remark: 'Maggie, ye hae a big step to your door!'

### CHILDREN'S DOLLERIES.

THE interest shown in the droll doings and amusing observations of little folks, is proved by the success of recent works on the subject. Most of us have some time or another heard children come out with as comical things as any, invented or otherwise, that we see chronicled. Not long since, a correspondent sent to a provincial paper an anecdote of the kind referred to, of which his six-year-old boy was the hero. He says: 'I keep a shop, and sell fancy goods. A gentleman came in to buy something. It was early, and my little boy and I were alone in the house at the time. The gentleman gave me a sovereign, and I had to go up-stairs to my cash-box. Before doing so, I went into the little room next to the shop and said to the boy: "Watch the gentleman, that he don't steal anything;" and I put him on the counter. As soon as I returned, he sang out: "Pa, he didn't steal anything—I watched him." You may imagine what a position I was in.'

Children's questions are often no less embarrassing than they are amusing, as may be instanced in the story of the mercenary little boy who overheard a conversation respecting a wedding that was soon to take place. At breakfast next morning he recalled the subject by asking the following question: 'Papa, what do they want to give the bride away for? Can't they sell her?'—A little one returning from the 'Zoo' through Regent's Park with a friend of the writer's, pointed to some flowers growing there, and inquired if they were *true* ones; meaning, of course, with his thoughts on the animals he had just seen, the reverse of wild.—At a whale exhibition, a youngster is said to have asked his mamma if the whale that swallowed Jonah had as large a mouth as the one before them, why didn't Jonah walk out at one corner.

'You must think Jonah was a fool; he didn't want to walk out and get drowned,' was the quick reply of a younger brother, before the mother could answer.

It is related of another infant inquirer who was looking with great interest at a foaming pan of milk, that he suddenly exclaimed: 'Mamma, where do cows get the milk from?'—'Where do you get your tears?' was the answer.—After a thoughtful silence—in which the mention of tears had evidently recalled certain associations—he again broke out: 'Mamma, do the cows have to be spanked?'—On seeing a house being whitewashed, a small boy of three wanted to know if the house was going to be shaved.—'Do you know how I get into bed so quick, mamma?' said a little girl.—'No, darling; how do you?' was the reply.—'Why, I put one foot on the bed, and then holler out "Rats!" and scare myself right in.'—A lady, when admiring the stars on a bright night in a tropical climate, was suddenly asked in the most innocent way by her little son of five years old if those were the nails that held up heaven.

Apt replies of little people when scolded or questioned find many illustrations, as, for example, when a little girl, after being sharply reproved by her mother for some misconduct, said after a

moment's pause: 'I should sink, mamma, from the way you treat me, you was my step-mover.'—A four-year-old boy lying in a bed in which his brother was also to sleep, replied, when his mother exclaimed: 'Why, Tommy, you are lying right in the middle of the bed; what will poor Harry do?' 'Well, mother, Harry has got both sides.'—Another youngster of about the same age, seated at the tea-table, said: 'Mamma, may I have some sarlines?'—'Wait till I'm ready, child.' 'Why, Ma, it's me 'at wants 'em,' was the comment, in tones of surprise.—A boy who had always refused to eat oatmeal, in spite of his mother's urgings that it was a strengthening diet, suddenly surprised her one morning by eating a liberal plateful and calling for more. Upon his mother asking for an explanation, he replied: 'I am bound to eat oatmeal till I am strong enough to whip Johnny Scott.'

Little Freddie when visiting a neighbour's house was offered a piece of bread-and-butter, which he accepted, but without any show of gratitude.—'What do you say, Freddie?' hinted the lady, expecting him to say, 'Thank you.'—'I say it ain't cake,' was the impetuous response.—The father of a family, after reading from the morning paper that the cold the night before was intense, the thermometer registering many degrees below freezing-point, said: 'Now, children, I suppose you are taught all about that at school. Which of you can tell me what the freezing-point is?'—'The point of my nose, papa,' was the prompt reply from one of the youngsters.

A gentleman somewhat advanced in life, and who was never remarkable for his good looks, asked his grandchild what he thought of him. The boy's parents were present. The youngster made no reply. 'Well, why won't you tell me what you think of me?'—'Cause I don't want to get licked,' was the answer.—An American mother, who fondly put the query to her young son, 'What would you do without a mother, Tom?' was dumfounded with the reply: 'Do as I liked, Ma.'—A mother once showed her child a beautiful doll, a St John, of fine make and colour. 'See,' she said, 'he has been very good; and heaven always rewards the good by making them beautiful.'—'Oh,' said the child, lifting its shoulders, 'don't believe that, mamma. This little St John looks very meek because he's all glued up; but if he could only move, you'd see!'

A little girl one morning remarked to her mamma that her 'button-shoes were hurting;' and probably thought relief might come by changing right to left. 'Why, Lucy, you've put them on the wrong feet!'—Puzzled and just ready to cry, she exclaimed: 'What'll I do, mamma? They're all the feet I've got!'—An affectionate mother noticing her little daughter wipe her mouth with her dress sleeve, asked what her handkerchief was for, and received for answer: 'It's to shake at the ladies in the street; that's what papa does with his.'

A nurse asked a little boy how much he loved her.—'How much is twelve-and-sixpence?' was the response. This was a sum he had lately heard his father mention, and in his childish notion, seemed the fittest standard wherewith to gauge the capacity of anything.—'Which of you two is the nicest?' was the question put by a gentleman about to give some sweets to twin sisters of tender

years. 'She is,' instantly replied both, pointing simultaneously to one another; an instance of polite self-denial that affords a strong contrast to the usual thoughtless egotism of youngsters.

Children's remarks are at times even more entertaining than their comical queries and replies. One of two children who were amusing themselves by colouring pictures, suddenly exclaimed: 'Well, how stupid of me to paint that cow blue!'—'Oh, it's blue with the cold!' quickly observed the other.—A little girl on being told something which greatly amused her, vowed that 'she would remember it the whole of her life, and when she forgot it, would write it down.'—A canary had begun to twitter a little after moulting, but was unable to sing its entire tune. A little four-year-old, after listening to one of the bird's vain attempts to master his tune, said very composedly: 'Mamma, birdie only sang half a verse.'—Canaries bring to mind their enemies the cats. A gentleman had a cat which gave birth to five kittens. On ordering three of them to be drowned, his little boy said: 'Pa, do not drown them in cold water. Warm it first; they may catch cold before they are dead.'—A relative of the writer's crossing the Channel when he was a very small boy, suffered much from sea-sickness. Hearing a good deal of talk on board about the motion of the steamer, he confidentially informed his parents on landing, that 'if he had a boat, he wouldn't have any motion to it.'

The following remark of a little girl shows an opinion of her elders the reverse of flattering. 'O dear!' she exclaimed to her doll, 'I do wish you would sit still. I never saw such an uneasy thing in all my life. Why don't you act like grown folks, and be still and stupid for a while?'—In contrast to this was the delicate compliment paid by an American boy to his mother. The family were discussing at the supper-table the qualities which go to make up the good wife. Nobody thought the little fellow had been listening or could understand the talk, until he leaned over the table and kissed his mother, and said: 'Mamma, when I get big enough, I'm going to marry a lady just like you.'

#### O LADY MINE.

FROM THE GREEK OF PAULUS SILENTIARI'S.

O LADY mine! there needs no crowning rose,  
No trailing robe, no gemmed circle rare;  
Thou'rt fairer than the pearl; and brighter flows  
Than gold, the sunny torrent of thy hair.

Though India's jacinth glow with dusky flame,  
It pales before thy lustrous love-lit eyes,  
The wondrous zone, sweet Aphrodite's fauc,  
Beneath thy grace and dewy lips, I prize.

• Thy willing slave, I faint and fade away;  
Life's sun sinks slowly in the humid west;  
But in thy smile, gleams Hope's deluding ray,  
And like pale Vesper, lulls my heart to rest.  
JAMES MILLINGTON.

## OUR LIGHTHOUSES.

LIGHTHOUSES as now constructed on the coast of the British Islands should be classed among the marvels of architectural ingenuity. The creation of a structure of this kind is on almost all occasions a severe test of engineering skill and persevering endurance. The difficulties experienced are frequently almost insurmountable; and human industry can have no nobler monuments than the massive piles which stand exposed to the full fury of the winds and waves on the jagged rocks which surround our coasts.

The Eddystone Lighthouse is now being rebuilt; but what could be a grander example of man's skill and enterprise than Smeaton's great work on that rock! Commenced in 1759, and completed in the face of almost superhuman obstacles, it has stood securely in the midst of the Atlantic breakers for more than a hundred years. Of late years it has been frequently surveyed, but was not finally condemned until 1877, when Mr Isaac Douglas of the Trinity House reported that it was not destined to exist much longer. Owing to very considerable tremor, which occurred with each wave-stroke during heavy storms from the westward, fears were then entertained for the safety of the structure, particularly as sea-water had frequently been driven through the joints of the masonry. The upper part had been strengthened in 1830 and 1865 with internal wrought-iron bars, extending from the lantern-floor downwards to the solid portion of the tower. On the last occasion, it was found that the chief mischief arose from the upward strike of the sea at the cornice; but repairs were effected, and further leakage prevented. The tower is still sound; but unfortunately the rock on which the lighthouse is built has been seriously undermined by the sea. The cause of this is said to be chiefly the incessant straining of the rock by the heavy sea-strokes on the tower. It was therefore resolved to erect another lighthouse, of larger dimensions; and a good foundation for this purpose was found to exist about one hundred

and twenty feet off the old site. Among other improvements which were thought to be desirable was the elevation of the light for a range of nineteen nautical miles, so that it might be extended more towards the Channel Rock, and made to overlap the range of the neighbouring Lizard light to the westward. In the old lighthouse, too, it was found that the sea rose in stormy weather above the top of the lantern, thus often eclipsing the light, and altering its distinctive character. This is a matter of greater importance in the present day than it was at the time of the erection of the structure, from the enormous increase in shipping, and the additional lighthouses which have been established, each having a distinctive character. The power of a light in so important a position as the Eddystone Rock, ought to be of the highest class; and since the capacity of the present tower is insufficient for this purpose, as well as for the provision of a first-class fog-signal, ample considerations existed in favour of a new lighthouse being built. The work is now progressing very favourably in the face of the immense difficulties which must attend such a task in such a place. It has been suggested that Smeaton's building should be re-erected on the mainland, when the time comes for it to be taken down, as doubtless it will be, upon the completion of the new lighthouse. It would not be difficult to find some point on the coast on which the venerable building might be erected, and do good service for another hundred years: while its preservation would be a just and fitting tribute to the memory of the great engineer with whose name it must always be associated.

During the greater part of the time in which it has done such good service, four keepers have been attached to it, three being constantly on the spot, and one on shore. They were relieved from Plymouth by steamer once a month; and the average annual cost of maintaining the lighthouse was about five hundred and eighty-five pounds.

A good example of the dangers incurred by those engaged in the construction of lighthouses, exists in the circumstances under which one, since

completed, was commenced in 1867, on a rock beyond the Isle of Sein, off Cape Finisterre, Brittany. The rock is of hard gneiss, from forty to fifty feet in length, and about twenty-five feet in breadth. The preliminary work was done by fishermen of the Isle of Sein, whose familiarity with those waters enabled them to reach the rock when no one else could do so. The *modus operandi* which these fishermen adopted was as follows: When opportunity offered, two of them, wearing cork belts, got out of their boats and lay upon the rocks, which they clutched with one hand, while they made holes at intervals of three feet with the other hand. While they were doing this, they were covered with spray, and sometimes they were swept off the rock altogether, and had to be recovered by their boats. In 1867, only eight hours' work could be accomplished upon the rock, and only fifteen holes were made. Next year, forty holes were made. In 1869, the building was commenced. In 1878, the tower was forty feet above the highest tides; and eventually, after more than twelve years had been occupied by its construction, it stood completed ninety feet above them. This is by no means a solitary or singular instance of the hazardous and tedious character of this work. Smeaton's difficulties when building the Eddystone Lighthouse, and Stevenson's when engaged in the construction of that on the Bell Rock, are familiar to nearly all of us, and have been detailed by themselves. Of more modern lighthouses, the most remarkable instances in this respect are the Skerryvore, on the south-west coast of Scotland, and the still more recent construction on the Dhuheartach Rock. In mentioning these cases we are impelled to refer to the services of the Stevenson family. The father, who built the lighthouse on the Bell Rock, had three sons who distinguished themselves in the same line of art. To Alan Stevenson is due the Skerryvore; and to his brothers, Thomas and David Stevenson, who succeeded to his fame, belongs the merit of the construction on Dhuheartach; this last a perfect wonder of engineering, for the rock had not a foot of landing, and operations were carried on with difficulty beyond all ordinary experience. No fewer than two thousand five hundred tons of granite were conveyed from Erraid, a small island south-west of Mull, and ten miles distant, and successfully placed on this almost inaccessible rock. The chief hindrance, which attends this work is the difficulty of keeping the foundations of the structure from being carried away by the sea; the winter gales often, as in the case of the Bell Rock Lighthouse, undoing the work of the summer and autumn, and carrying out to sea blocks of stone many tons in weight.

If lighthouse-building requires perseverance and endurance, lighthouse-keeping requires the exercise of the same rare qualities in degrees scarcely less striking. We are essentially a maritime nation; and all those who look after the safety of our seamen, and facilitate the merchant service of the world by rendering navigation on our coasts less perilous, deserve well of us. It is difficult to realise to the full the horrors and the privations which must attend the life of a lighthouse-keeper. In most isolated lighthouses, it has been found strictly necessary

to have three men on the spot at one time, in order to lessen the terrible loneliness of such a situation. Many tales of horror are extant concerning lighthouses. In one well-authenticated instance, one of the keepers went mad during a hurricane and killed his companion; and on another occasion, in the same lighthouse, one of the keepers being drowned, the other, overcome by the horrors of his situation, committed suicide. Happily, however, nowadays occurrences of this kind are exceedingly rare, and the service is filled by intelligent and trustworthy men, who take a pride in their duties and are reconciled to their life. The usual arrangement is for one of them to be on shore for a week or a fortnight at a time; while the others, whether they are two or three, are on duty in the lighthouse; in this way all the keepers have frequent relaxation from the rigour of their life. In most lighthouses, small libraries are now provided, and supplied with books and magazines, which are a most invaluable source of amusement to the keepers when off duty. It would be difficult for any one to find a better or easier way of alleviating the hardships of a most deserving class of men, than to send off parcels of books and papers occasionally to some of these desolate stations, and such kindness would certainly be heartily appreciated.

If those on shore are awed by the terrible violence of the winds and waves during a tempest, what must be the experiences of men who live in a building exposed to the full fury of the heavy ocean breakers! When we look at a lighthouse in calm weather, it is almost impossible to realise that the sea sometimes breaks over the lantern. Such is, however, frequently the case, and an instance of this occurred not long after the completion of the Bishop's Rock Light, which is erected on a rock beyond the Scilly Islands, far out in the Atlantic. One of the builders told of a heavy sea striking under the lantern and carrying away the fog-bell, which hung by a stout arm of iron nearly three inches square. A few years ago the lighthouse keepers on this rock were in a terrible predicament during a hurricane, the violence of which was described as being fearful. The lighthouse was struck by enormous waves in quick succession, each causing a noise like the discharge of cannon, and making the massive stone building rock to and fro, so that every article fell away from its place. One fearful sea broke the great lens in several pieces, and another smashed the cylinders of the spare light, while sand from the bottom, thirty fathoms deep, was found heaped up on the lighthouse gallery. The power of these unbroken masses of water is so great that lately, at Wick, one of these shocks moved 'a concrete block of four hundred tons built up *in situ*.'

There is now an influential movement on foot to establish telegraphic communication between lighthouses, lightships, and the shore. It is certainly a question of the greatest moment, and it is impossible to say how many valuable lives, and what an immense quantity of property, might be saved if such a means of communication existed between lighthouses, lightships, and harbours and life-boat stations. Only very recently, a meeting was held at the Mansion House, and was presided over by the Lord Mayor, at which the following resolution was carried unanimously: 'That, in the opinion of this meeting, it is a

matter of urgent necessity that electric communication should be established between the various lighthouses, light-vessels, and the shore, in order that more speedy intimation of vessels wrecked and life and property in peril may be afforded to those ready to come to the rescue.' Steps were also taken to bring the matter under the attention of the government. The question is certainly one of national interest. At the present time, the signals from the lightships, by means of guns and rockets, only convey the tidings that a ship is on shore or in distress, and it is impossible to estimate the amount of help needed, or the position of the wreck—both matters of vital importance. Thus, two or three lifeboats at some dangerous points of the coast may proceed to the same vessel, which may prove to be only a fishing-smack; while a large passenger-ship may at the same time be left unaided, or with only the assistance of one boat. In the same way, if the position of a wreck could be made known, much, and, in many cases, most invaluable time, which is now frequently lost while making out her whereabouts, would be saved.

Another question of great importance is the best method of giving a distinctive character to lighthouses. The one final cause and purpose of a lighthouse is to make known to mariners with unmistakable precision a certain spot to be shunned as dangerous. If such exactitude is wanting, it may but help to lure them into positive peril. Of our coast-lights, about ninety per cent. are fixed, and it has been said that in many cases these may but too possibly be mistaken for something else. As is well known, our revolving lights may fairly be said in general to answer their purpose. They revolve in different periods; combinations of colour are employed; and there are also flashing lights. In the Admiralty list of lights, some are mentioned as both fixed and flashing; and of these, there are several varieties. Such 'fixed and flashing' lights are not now considered to be wholly satisfactory beacons, when the flashes occur at intervals of five or six minutes; since it is quite possible for a steamer travelling at sixteen or seventeen knots to miss the flashes, and mistake the position of the light. A revolving light is much better, and is gradually being more generally adopted. It can be seen at a greater distance, and is more easily distinguishable. Sir W. Thomson has successfully advocated this system, and has pointed out various improvements which might be made in existing revolving lights. He thinks that an eclipse of from fifty to sixty seconds is too long in dirty weather, and that the watching eye might easily let it slip before its bearings have been taken. He suggests that greater regularity should be aimed at in the periods of revolving lights, and he considers coloured distinction to be unsatisfactory, because it is so easy to mistake coloured lighthouses for the port-side lights of passing ships, and because instances have been known of red railway lights, and even those of apothecaries' shops, having been confounded with harbour lights.

Among other improvements in lighthouses, one of the best is the plan of making each spell out its name—on the familiar telegraphic alphabet principle—by a system of dot-and-dash eclipses, so that a seaman could at once tell at what light

he was looking. The movements for effecting these changes would, of course, be automatic, and the plan has already had seven years' trial on Belfast Lough. Sir W. Thomson's own Craigmoor light, in the Firth of Clyde, is another good example of this principle. Here a long and a short eclipse alternate twice; and there is then a short pause, giving sixteen seconds of unbroken light. This combination of four eclipses is made conventionally to denote the letter C, the initial of Craigmoor.

It would be easy to increase the utility of lighthouses. There is no reason why a light should merely tell ships that they are off a certain point of the coast. It could tell more; it could tell which way the tide was running, information which would be of great value to homeward-bound ships. Another idea is that lighthouses at particular hours of the night could give signals which would tell the Greenwich time, and thus enable vessels to correct their longitude. In our narrow seas, liable to alternate fog and storm, and crowded with the merchant navies of all nations, every effort should be made to render casualties less probable, and to lessen the perils to which those are exposed 'that go down to the sea in ships, that do business in great waters.'

[Many difficulties naturally surround a question upon the settlement of which may depend the lives of many of our fellow-creatures. The difficulties that stand in the way of signalling by means of 'dot and dash' are greater than at first sight appear; and the following opinions on the subject, communicated to us by the captain of a vessel, have at least the merit of being from one possessed of practical knowledge:

'I am convinced,' he writes, 'that the only thing requisite in determining the character of lighthouse lights is to make them as simple as possible, and if practicable, let no two lights on the same coast have the same characteristic. Let the mariner feel confident, when he sees, for instance, a bright fixed light on a certain coast, that it must be such and such a light; for the simple reason that there is no other of the same character on that coast. He is then certain of his position; and surely plenty of combinations of the fixed, revolving, and intermittent lights either white or red can be conceived for our longest coast-line, without having two alike, unless at such a distance apart as to make mistake impossible. Certainly the "dot-and-dash" system, so far as it has been applied, has been successful, for the reason that it is as yet the distinctive characteristic of a certain light to which it has been applied, and is easily distinguishable. But place all our coast-lights under the same system, and the distinctive feature of this one light is obliterated, and the mariner confounded.

'Few people would credit the difficulty often experienced of timing a light at sea, it seems so easy a matter to distinguish between five, seven, fifteen, or twenty seconds; but standing on a steamer's bridge and holding on with both hands to keep one's self from rolling over the side, while a glimpse of the light is only caught when the vessel lifts on a sea, makes it no easy matter; and it is often impossible to judge the duration of one of our present half-minute revolving lights to within five or even ten seconds. It is only by

the merest guesswork, and the important knowledge that there is no other light of similar or nearly similar duration near your position, that you are able to say that that light is so and so. In such a case the "dot-and-dash" system would be worse than useless; so that of whatever duration our flashing and revolving lights may be, let no two of the same character be near each other of such duration as not to be clearly unmistakable one for the other.

'Again, the danger is urged of mistaking lighthouse lights for a steamer's mast-head light; and in answer to that I say that the only description of lighthouse light liable to be so mistaken is the white fixed light, though in clear weather it is unmistakable, owing to its superior brilliancy, for anything but what it is. In thick weather, a steamer's mast-head light, in order to illuminate the fog, as lighthouse lights invariably do, would have to be so close that the side-lights would also be visible.

'Our present system is now almost as perfect as possible. Let us stick to the distinctive feature of each light, so as to produce as little chance of mistaken identity as possible, and let science do its best to increase the power and brilliancy of our lighthouse lights, so as to make them even more distinctly visible, as in the case of the Lizard lighthouse *reflection*, which I have seen in the sky for more than two hours before the lights themselves were visible from the deck. I feel confident that any attempt to do away with the distinct individuality of our various lights will only lead to disaster. As they are at present, each of our lighthouse lights carries its name to the utmost limit of its range as unmistakably as possible, and will continue to do so as long as the peculiar characteristic of each light is maintained, but only till then. Make them all indicate their names by the "dot-and-dash" system, and I for one would not like to be the mariner whose safety depended upon his ability, on a dark dirty night, to distinguish the difference between a dot and a dash.']

## THE COUNTER-SYNDICATE.

### CHAPTER I.—A BRUIN STORM.

THE financial house of Fox, Smiles, and Naylum was known wherever the echoes of British commerce reverberated. Bank managers bowed before it; merchants held it in reverence; traders regarded it with something like awe. Its ramifications were vast; its sources of information were generally exact; its advices of the coming plethoras and scarcities of produce so early, that it played a master-part in the transactions of the City. It was linked with great financial houses in the capitals of the world; and through them it worked out the wondrous changes that came over the markets on which it operated. On a certain day in a certain year, now remote, Mr Smiles, who attended to the secret correspondence, wrote to the trusty agents of the firm in Paris, Messieurs De Predatour, Toutail, & Cie, the following laconic note: 'Sell one hundred thousand bags Costa-Rica Coffee, to arrive October and November.' A similar note was forwarded to Herren Sharfsmann und Geldmacher, the well-

known brokers of Hamburg. Another to the same purport was despatched to Messrs Buldose Brothers & Co., hailing from New York, Boston, and San Francisco, U.S.

In the meantime, Mr Fox saw Mr Box, the broker of Mincing Lane.

'A hundred thousand bags!' cried the latter, amazed—and he was not easily amazed—at the orders confided to him by Messrs Fox, Smiles, and Naylum. 'Why, my dear sir, it will quite demoralise the market!'

Mr Fox was a clean-shaven man, but not the faintest ripple of feeling responded on his face, to the astonishment of Mr Box. 'A hundred thousand bags Costa-Rica, delivered by the twelfth proximo,' repeated Mr Fox calmly. 'Of course you will sell as quietly as you can. We have every desire to keep the market firm. I trust implicitly to your judgment, Mr Box.'

'It is the greatest thing ever attempted in my time,' said the broker when alone. He was old, and undrilled in the ways of cablegram-trimmed commerce, then just beginning its career.

Mr Box went about that day in a musing mood, and he was not a musing man. He sold parcel after parcel of Costa-Rica Coffee, and by the afternoon twenty thousand bags were disposed of, for the market was bare of the article. The next day, under a thaw of price, more was sold; and by the end of the week, the City and the great northern towns had enabled the broker to complete his commission.

But the market had grown very unstable, and coffee of all descriptions was singularly perturbed. The talk among merchants was unusually animated. Where was this vast stock of coffee lying? Had some speculators been accumulating a heap, which was now launched upon the market by pressure of the banks? Had they been misled by West Indian advices? Was a big collapse impending, that would cause a financial storm? If so, to your tents, O Israel!

Brokers were agitated too. A sort of mania seemed to be running through the coffee world. At Havre and Brest, there reigned an unaccountable depression, consequent upon what seemed forced sales of Costa-Rica. The produce market at Paris was electrical, for a rumour ran that a gigantic lot of Costa-Rica had been thrown upon the Hamburg market, which staggered under it alarmingly.

But most astounding of all was the news coming from New York. Coffee had there begun to run downwards, and it appeared that Boston and San Francisco were deluged with selling orders. Strange, very strange; everywhere people were offering coffee, especially Costa-Rica sorts.

Mr Quick, the confidential clerk of Messrs Fox, Smiles, and Naylum, was one of the lesser magnates of the City. People supposed him to be acquainted with all the ramifications of the great house he served. But that was not correct. There were confidences too sacred even for his highly remunerated fidelity to be intrusted with. He knew many marvellous things connected with the commercial mysteries of his firm, but he did not know all. His employers had faith in his ignorance of their secret transactions. Now, Mr Quick had as strong a desire to be a

millionaire as any man then inhabiting the purlieus of the City. He had, too, a genius for financial intrigue, and extraordinary grasp of commercial affairs in their most complicated entanglements. These gifts had caused his unprecedented advancement in ten years from the position of junior clerk to that he now occupied. No firm was readier to reward business ability exercised on their especial behalf, than Fox & Co. Perceiving Mr Quick's abilities, he was advanced from post to post, from stipend to stipend, until he was everything but a partner in the concern.

Being under no illusion of personal unworthiness, he thought the crowning step of at least a small partnership in the ladder of advancement his simple due. Messrs Fox, Smiles, and Naylum thought quite otherwise, especially Mr Naylum, who had risen from the counting-house himself, and who had been jealous of Mr Quick for some time. Mr Smiles also was averse. Mr Quick had offended him also by being too clever. In a big transaction in spice, Mr Quick had foretold disaster, against the opinion of Mr Smiles, who was sanguine of a rise. The disaster came; for the shrewdest miscalculate now and then. Only Mr Fox was favourable to taking the ambitious clerk into a small partnership, though even he grudged that the splendid harvests reaped by himself and the others should be diminished by a further 'divide.'

So Mr Quick was informed that he must be content to be simply the highly esteemed jackal of the establishment, as the lions were unwilling to admit him to share their honours and glory. He received the verdict with becoming fortitude, and retired to ponder how he should compass, by indirect means, that denied him otherwise.

This happened about three months before Messrs Fox, Smiles, and Naylum became large sellers of coffee.

A fortnight after Mr Box the broker had executed his leviathan commission, young Box, his son, met Mr Quick at the lunch-table both frequented, though they rarely came in contact there. Young Box, like most young City men, was unusually wise for his years. At twenty-two he knew more than his father, who had frequented Mincing Lane for forty years.

'I say, Quick,' he said, observing the latter looking for a seat, 'come here;' pointing to a chair beside his own.

Mr Box lunched copiously, as hearty young men who can afford delicacies of meat and drink, are apt to do. This morning he had won a sovereign from a friend at the cheerful game of 'Nap,' as they came to the City in the train. Strong in the consciousness of his deserts for this achievement, he had treated himself to a small bottle of Munni's champagne, a drink he preferred to all others, though he was sadly limited in this pleasure by the small allowance his father permitted.

Rather to the annoyance of Mr Quick, who was not a companionable man, and who had, besides, but a small opinion of young Box, the youngster insisted on his sharing a bottle of champagne with him. The hospitality would have been almost rudely declined, for Mr Quick

was in an irritable mood, as clever people often are, but for the remark which closed the invitation: 'If your governors liked, they could drown us both in champagne, after this last go!'

Mr Quick cast a rapid glance at the leering eyes of his companion. He sat down, and the waiter filled his glass. By the time the bottle was emptied, young Box wanted two things—a cigar in the smoking-room, and a further talk with Mr Quick, who had shown a singular appreciativeness, of the young gentleman's smart chatter about the coffee market. No man could excel Mr Quick in suave attentiveness, when it suited his purpose, or could more favourably excite self-admiration in another. And Box looked upon Mr Quick as one of the young City heroes, who had fought his way to the front in something like a miraculous manner. Everybody admitted that he would become one of the big men of the future, and it gratified young Box to be seen in his company. So they went to the smoking-room, which was empty; and under the influence of a brace of cheroots and a couple of glasses of Chartreuse, Box laid bare all the movements of the coffee transaction, supposing, of course, that Mr Quick knew all about them. He revelled with vulpine delight at the tremendous results of the tactics of Fox, Smiles, and Naylum upon all the markets. Such smartness was worthy of all praise; and the youngster hugged himself with the supreme satisfaction, that his father had a share in the business. Young Box was a true child of the age he lived in.

Mr Quick had been away for a holiday on a fishing excursion, and was quite unaware of what had taken place in his absence. He invited young Box to look him up at his lodgings, and sent him away from the *à-la-tête* in the smoking-room almost delirious with self-conceit.

That night, Mr Quick stayed late at the office. Before leaving, he had a perfect grasp of the coffee production and consumption for the previous three years. He smiled strangely as the totals emerged from his calculations; and when the whole problem was worked out, a strong exclamation burst from him, and he said: 'Now, Mr Smiles, you shall acknowledge your master.'

During the ensuing fortnight, the coffee market went tumbling about in queer zigzag fashion; now down with a plunge, now up with a sharp rebound. In the words of broker Box, it was demoralised. The great impact of Fox, Smiles, and Naylum had led to hundreds of smaller impacts from various quarters. Hebrews in Amsterdam, Rotterdam, Vienna, Buda-Pesth, and elsewhere, hearing what was going on in London, Paris, Hamburg, and New York, became most anxious to show due sympathy with the movements of those great markets. Other citizens likewise manifested an eagerness to further lower the price of coffee of all descriptions, but chiefly Costa-Ricas, and sold largely upon speculative account.

So the game went on right merrily. The great bears\* became the parents of a wonder-

\* Although commercial slang has a currency beyond the purlieus of the Exchanges, many of our readers may not know the exact import of the terms 'bull' and 'bear.' The former is a speculator who buys stocks or

fully numerous family of little bears of the most diverse nationalities. Even Turkey had some of them; for with the downfall of Costa-Rica sorts, Mocha fell profoundly, and the followers of the Prophet were enabled to enjoy their one permitted stimulant at a price so equitable, that quite a burst of gratitude ran through the streets of Constantinople, and grocers rose to unwonted altitudes in popular estimation.

Those who took part in the coffee earthquake, as some one called it, will never forget those stirring times; far beyond the confines of the coffee markets did the shocks and tremors range. Other commodities were affected. Tea, for instance, began to show coquettish conduct unknown to the oldest brokers; sugar palpitated from China to Peru; chickory went crazy. Old traders declared that if coffee was to be sold at the prices it had fallen to, chickory would be henceforward a mere historical article.

But the strangest characteristics of this fevered time were the absurd paragraphs and leaders which appeared in the newspapers. One was headed:

*'Good News for Coffee-drinkers.'*—It has hitherto been supposed that the coffee shrub is limited to the regions now devoted to its cultivation, and that it can only be grown under special conditions of climate and soil. Also that the species is limited to a few varieties. This has been recently proved inaccurate. The great German traveller and *sarant*, Professor Weissaliedinge, has discovered in Central America vast forests of a coffee-bearing tree, most of which grow to upwards of fifty feet high! It is said that the size of the berries is four times that of ordinary coffee, and that the flavour of this new species is superior to the most aromatic kinds grown in Arabia. The immense supplies from this source will soon place coffee in abundance upon the tables of the poorest classes, and convert a luxury into a common necessary of life.

This paragraph went the round of the provincial press, and created a flutter in the breasts of the grocers whose eyes fell upon it. No wonder that chickory and other substances employed to modify the powerful effects of unsophisticated coffee, fell into discredit. If coffee were to become as abundant as the paragraph alleged, it would be taking an advantage of the public to mix it at all.

Another paragraph was entitled:

*'A Revolution on the Breakfast Table.'*—Hitherto the world has depended upon the bounty of Nature for the beverages that grace the morning meal. But Science, which neither slumbers nor sleeps, has just won a triumph, that threatens to abolish the Chinese leaf, the Arabian berry, and the seductive Theobroma nut, and render mankind independent of similar vegetable productions

commodities in the hope that when the fortnightly day of settlement comes round, the price of the stock or commodities will have risen, in which case he will pocket as profit the 'difference' between the price at which he bought and the price on the day of settlement. A 'bear,' on the contrary, sells largely first, and buys afterwards at a lower price when the market has become glutted. Of course, if the price should rise when it is expected to fall, and *vice versa*, the 'bull' or the 'bear' must pay the 'difference' when it is against him. A 'syndicate' is a combination of 'bulls' or 'bears,' and is a new method of commercial speculation.

altogether. The great French chemist, M. Syntheseur, after twenty years' researches, has demonstrated that *theine* and *caffeine*, the essential principles of tea and coffee, are merely forms of nitrogen. These he has succeeded in making in enormous quantities. All that was wanted to produce tea and coffee in the chemist's laboratory was a woody fibre that would absorb *theine* and *caffeine* in the right proportions. This has been the difficulty with which M. Syntheseur has struggled. It has now been overcome by one of the pupils of the great *sarant*, who by accident spilled some laboratory *caffeine* upon a heap of sawdust. In a few hours the mixture became so completely transformed into a substance resembling ordinary coffee, that one of the porters of the establishment, supposing it to be the veritable article, made an infusion of it for his breakfast. The extraordinary aroma attracted the attention of M. Syntheseur's gifted pupil, who found thus, by pure hazard, that missing link in the great chain which the Professor commenced to forge twenty years ago.

'We understand this chemically manufactured coffee can be sold retail at a penny per pound! Moreover, the gain of the public will be the greater, because, owing to sawdust being already in a pulverised state, coffee-mills will no longer be required. Of course, the method of preparing chemical coffee is a scientific secret; but it is said that a gigantic Limited Liability Company, having depôts in every country of the world, is now in process of formation to work the patents of M. Syntheseur.

'Sawdust, hitherto considered little better than rubbish, and of no use whatever, beyond spreading on the floors of butchers' shops, has now risen to importance. Here is another waste product of our industries proving of priceless worth! We have long known that Baron Liebig was in the habit of making quartern loaves out of deal planks, and that a billet of wood furnished a staff in a double sense, namely, a cudgel for defending the outer man, and a French-roll for keeping the stomach in awe. But that sawdust should take the place of our Congous, Mochas, and Theobromas, is, as we have before said, a Revolution on the Breakfast Table.'

These paragraphs were shown to Mr Quick, who read them with an eye that lost something of its habitual hardness, while his mouth assumed a quite unwonted genial curve.

## INDIA IN THE RAINS.

BY AN ANGLO-INDIAN.

I MENTIONED on a former occasion that the most trying period in the Indian 'hot weather' was the interval of calm between the north-east and south-west monsoons. That lull has arrived, and Nature, exhausted by the fierce heat of May, seems overpowered; the heavens above us are as brass, and the earth as iron; animal life is in a state of quiescence—even the crows hop or fly about dejectedly with gaping beaks. The trees are in absolute rest, longing for a breath to bring movement to their leaves and twigs, wondering, perhaps, why the subsoil moisture, which they have been so patiently distilling into the atmosphere for months past, is not returning in grateful showers,

to wash their dust-begrimed leaves, and open out their breathing pores. The earth is hard as adamant, and of a uniform whitish brown; green is nowhere visible, except in cultivated patches, or in the neighbourhood of wells; and the shadow of death, as it were, rests on the land.

Yet the enforced sterility is not absolute; the Mudar (*Calotropis gigantea*), for instance, rejoices in the most sterile wastes, and exhibits its large leathery leaves, pink and white flower bunches, and singular pods, as a proof of the presence of a beneficent Providence. And if you closely examine the surface of the arid soil, you will discover numerous specimens of a diminutive convolvulus, displaying its tiny leaves and delicate pinkish-white flowers, as another proof that life is struggling for existence amid the prevailing death. Many a time, like Mungo Park's moss, that humble little plant has read me a lesson of patience and encouragement; and you feel that if such a diminutive and humble plant can rejoice amid the surrounding sterility, its joy will in due time be imparted to the wastes around.

And so it happens. The eager observer of the southern sky is at last rewarded by seeing in mid-June, or earlier, a few cirrhus clouds adorning the sunset; in a day or two they have coalesced into cirrho-stratus, which the setting sun gilds with effulgence; another day or two develops them into cumulous masses, into the dark interiors of which the sun flings his parting rays. We watch on into night, and see these depths illumined by distant lightning; and now we know that the monsoon is approaching, and that we shall soon hear the noise of its chariot-wheels. Next day, the greater portion of the southern sky is veiled with cirrho-cumulus, and we feel the breath of the approaching blast in grateful puffs of cool air. During that night, or at the latest, next day, deliverance arrives. During daytime you may notice the heavens waxing 'black with clouds,' from which suddenly a dazzling flash of lightning leaps out, immediately followed perhaps by a deafening roar of thunder. Then the storm comes on; flash follows flash, and peal succeeds peal in awful grandeur, and the labouring clouds discharge their burden in tremendous rain. Oh, the joy of that downpour, and how eagerly we throw open every door to admit the delicious breeze! The glad watchword on every lip is now, 'The rains are in;' and Nature re-echoes the welcome. How delicious the smell of dust laid by rain! You feel as if you could not sniff it up sufficiently. And how strange the cleanliness which meets you on all sides. It seems that spring green has set in everywhere in a moment, for the lately dust-begrimed trees stand out bravely in their legitimate verdure, rejoicing in the cleansing and invigorating bath they have enjoyed.

The first downpour often lasts for twenty-four hours; and when you go abroad, you are amazed at the change in the landscape. Those white, arid wastes which dazzled your eye, are now clothed in the most delicate emerald green; all the humbler classes of vegetation seem to be engaged in a race for existence, each vying with its neighbour in assuming the verdant garments necessary for the struggle. Look at the roadside ditches, and you will see sights equally amazing. Before the rains, they were simply shallow trenches, obscured by dust from the road, and apparently

utterly void of life, animal or vegetable. Observe them now, lined with pools of pellucid water, resting on vegetation rank and green, and teeming with animal life, aquatic larvæ of all kinds, small fish and frogs. Among the last, you will probably see a huge green-and-yellow bull-frog, six to eight inches long, either submerged in the water, his nose and eyes alone exposed, or resting on the bank waterwards. If you approach him quietly, you may catch him in his song of jubilation at the arrival of the rains, his cheeks puffing out as large as plums, and the sound carrying you back to your school-days. Whence came this sudden life, and where were its components a week ago? Our attempts at answer land us in one of the greatest puzzles afforded by India—the question of fish-showers, two of which I have seen.

It is easy enough to account for the larvæ of aquatic insects, and not difficult to understand that their eggs and the frogs may have lain dormant in the mud, awaiting 'the scent of water.' But whence, in the first instance, came the fish? This is hardly the place for ventilating this question, so I will merely describe briefly two fish-showers, and then narrate two facts which may throw light on the subject.

During the rains of 1864, I was residing at Arrah, in a large house with a flat roof, and during a heavy shower, the cry was raised by my servants that fish were falling from heaven. I rushed out, and found the compound (court-yard) strewn with small dead fish, from two to three inches in length; while from the roof, two or three bucketfuls were procured. Whence came the fish? Undoubtedly, from the sky; but how they got there, I am not prepared to state, unless they may have been carried into the air from their native element, by a water-spout. Arrah is situated in the corner where the Sone enters the Ganges, and is about seven miles from either river—the only possible sources of the fish.

The second fall occurred four years after at Patna—which is about one to two miles from the Ganges—and also during the rains. On starting on my rounds one morning, I drove over a bridge crossing a then dry watercourse. During my absence, heavy rain fell; and on my returning home, I found the watercourse full, and a crowd of natives shovelling out quantities of the same small fish, all dead.

Another curious fact relating to fishes. On one occasion, while stationed at Arrah, I came across a specimen of the climbing perch (*Anabas scandens*) struggling along the road at least half a mile from the Sone, to which I had it transferred alive and vigorous. It may have embarked on that strange journey to spawn, leaving its eggs in a roadside ditch; but then a difficulty arises in its being alone.

I have often come across vagrant turtle miles from any water, and on one occasion found a nest, the young from which might have been found in a roadside pool, occasioning curiosity as to how they got there.

Insect life starts into profuse existence on the setting in of the rains, and often occasions us great annoyance at dinner-time; the white table-cloth and the careless presence of lamps thereon affording irresistible attraction to countless hordes of invaders, among which winged termites—that is, white ants—stand pre-eminent; and their invasion

is very remarkable. You have recently arrived in the country, are living in a *kutch* house (built of sun-dried bricks and mud-mortar), have made yourself comfortable therein, and are going to have your first dinner-party. All your nick-nacks are proudly displayed on your table, and in its centre blazes your lamp, just unpacked. The dinner-hour approaches, and you nervously take a look round to see that all is right. One or two insects, new to you, are fluttering about the lamp, or on the table, and in brushing them off, you perhaps notice that the same insects are swarming out of a corner or from the floor. Your guests arrive; and while receiving and marshalling them in to dinner, the insect invasion has assumed formidable proportions, so that when you sit down to soup, you find the air around the lamp alive with termites, and your fair cloth covered with them. Every sup-plate is stuffed with them, as also your glasses of sherry. In despair, you appeal to the company, or to your table attendant; and are advised to remove the lamp at once from the table. On doing so, the invaders on the wing are diverted; and then you notice that the thousands on the table have dropped their wings broadcast, and are now chasing one another about. In comparative darkness, you finish your dinner, and adjourn to the drawing-room. When your guests have left, curiosity takes you back to the dining-room; and you find the table and the site of the removed lamp strewn with myriads of wings, and their owners nowhere.

Watch the insects outside, and the sight is equally wonderful. From a spot in the ground where you would least expect it, you find one or two termites fluttering into the air; watch them narrowly, and you will find a minute hole, far too minute for the hordes which are squeezing out of it and then rising into the air. Around the hole, half-a-dozen wingless workers are fussing frantically. But let us watch the perfect insects, and return afterwards to the workers. Soon we see a pyramidal cloud of insects in the air, the apex resting over the hole. This becomes denser and spreads wider as the breeze catches their wings. News of the flight have been telegraphed far and wide. Sparrows and crows, fly-catchers and king-crows, kites and mynas, flock to the scene, and gorge on the fliers. (Kites feast laboriously; every termite is individually seized with the talons, and then disposed of by the beak.) If evening is setting in, bats and even frugivorous flying-foxes join in the revel, and termites are devoured in myriads. Turn again to the hole whence the last termite has emerged, and you will find the workers busily engaged in plastering it up again, and destroying all traces of the flight. The few survivors of the swarm seek the earth, drop their wings, and disappear. The dropping of the wings is a marvellous process; two pair, with all their machinery of blood-vessels, nerves, and ligaments, are instantaneously dispensed with, and the insect seems livelier than before; and this mutilation occurs precisely at the exact moment. Seize a termite by the wings at the wrong moment, and he will struggle violently to escape, the wings remaining firm in your grasp. Seize it at the right moment, and you will see it lift its body upwards and backwards like an earwig, deliberately unhook its wings, and so escape.

Here is another incident of the rain period. You are sitting at dinner with all your doors open, and suddenly you hear a familiar sound, and a beetle is wheeling 'his droning flight' around the room. Flop! he falls on the table half-stunned. You seize him, and are amazed at the strength of his struggles, and still further at the squeak he utters; showing that he must have vocal organs—like the death's-head moth, which squeaks loudly when touched. Examine him, and you will find that he is the Egyptian scarab (*Scarabeus sacer*) or dung beetle, varying in size from half an inch to an inch and a half long, and relatively, I believe, the most powerful animal in the world. Take an inch specimen, and place him on the tablecloth under a full quart bottle of wine or beer. Presently, you will see the bottle move; and if unchecked, it will slide mysteriously across the table, pushed by the giant beneath in its efforts to escape.

Yet one other incident. Towards the close of the rainy season, generally in September, 'flying-bugs' appear on the scene, attracted as usual by the light; small black and shining heteropterous insects, surcharged with a disagreeably powerful odour, which they generously distribute all around. You may encounter a flight when out driving in the evening, and perhaps feel something creeping in your whiskers. On raising your hand to eject the intruder, your nose is overpowered, and your fingers defiled, with the odour.

These insect visitations are undoubtedly a trial; but they are not confined to India; for in Scotland, both at Arran and Lasswade, I have been put to flight by midges, which were infinitely more ferocious than those out here.

▲ Travelling in the rains, away from the rail, is just as serious as it used to be in old times, especially if your vehicle be the palkee. It is no joke to be caught by the rains on a journey, and have to put up with the shelter of a serai (roadside hut) or a tree, because the nullah ahead of you, which yesterday was a dry watercourse, is now a formidable stream. No joke, in the midst of pelting rain, the thickest darkness, and the roar of thunder, to have your palkee put down in the road—itsself a stream—because your torch has been saturated and extinguished, and the bearers have lost both their way and their heads. No joke, under these circumstances, to try and keep yourself dry. Not only will the driving rain come in at every chink, but the splash from the road gradually wets you from below. So the weary night-hours pass, and the gloomy break of day finds you quite alone. The bearers have gone off in quest of shelter, and will suit their convenience in returning to you; and, wet and weary, you must do your best, until the rain lifts a little, to permit of your onward progress.

How well I recollect being thus caught in 1854 on the road from Meerut to Umballa! Anxious to push on, I had reached the dák bungalow at Jagádree, and thrown myself on a bed to sleep while breakfast was being prepared. I had hardly done so, when a terrific crash of thunder made me jump to my feet, ushering in a storm which effectually dissipated all ideas of rest. When the afternoon starting-hour arrived, the bearers told me it was useless proceeding, as all the rivers and nullahs between Jagádree and Umballa—and they are not a few—would be impassable. With the obstinacy of youth, I

determined on proceeding, notwithstanding the heavy rain, and I then encountered the experience above described.

When my bearers did come back, they told me that a raft had been prepared for my transit, which cheered me considerably. Presently, I was told that it was ready, and poked out my head to see.

'Where is the raft?' I inquired.

'Here, my lord;' pointing to nine round earthen pots lashed together into a square with bamboos and twine, the whole concern floating uneasily on the troubled stream.

'Am I to cross on that?' I feebly inquired.

'Yes, my lord. There are no boats on this nullah.'

Alarmed at the nature of the vessel which was now to carry Cæsar and his fortunes, I determined that the latter should go first; and so my two boxes were lashed to the frail structure, and two men swam over with it. Cæsar's chariot (the palkee) then followed successfully, and then that hero's turn came. Assisted by the bearers, he squatted on the wet globe of the central pot, carefully arranged the centre of gravity, with stolid dignity closed his eyes, set his teeth, and grasping the slippery pots, launched out on the flood, his legion of bearers swimming around and guiding the frail raft. That the voyage was successful is evident from the commentary now penned, which may further announce that on that memorable day, without bridges and without boats, Cæsar crossed more rivers, each in a different fashion, than has fallen to most heroes in a lifetime.

The temperature during the rains is very pleasant; but when a break occurs, allowing the sun to come out and evaporation to set in, it becomes very muggy, the still air being laden with moisture. Then it is that prickly-heat adds its quota of annoyance to those predisposed to that troublesome affection. But taken all round, the rains are a pleasant season, and a happy preparation for the full enjoyment of our unequalled cold weather, some account of which I shall give in my concluding paper.

## THE STORY OF A THUMB-MARK.

### IV.

ELIJAH CARSON the detective was a somewhat remarkable man. As he sat down, you might not have noticed anything particularly striking in his appearance, beyond a look of concentration in his face. Nor did his looks belie his character. He was a man of inventive resource, of tenacity of purpose; and in the pursuit of his profession, he took an enthusiastic interest. And at present, called to investigate the mysterious murder of Anthony Greig, he had no other purpose than to demonstrate the crime as it really happened. He had been sent on the case when the first intelligence arrived; and his first object was to find young Anthony Greig. In this he anticipated little difficulty, for he was informed, by one of the clerks who had seen Beesley, that Greig was about to proceed to London. Acting on this information, and hoping to overtake the fugitive before he should reach the Metropolis, he lost no time in getting to the railway platform. He had a photograph of the young man with him; and with this

and the description received from Sinnott, he felt fairly confident of finding Greig, if not on the journey, in London itself. Conning the picture, Carson paced the platform, and mentally had his eye on scores of people at once. The optical battery of Argus himself could scarcely have more carefully scrutinised the numerous intending passengers than did his one pair of steel-gray eyes. Suddenly, his face lost its appearance of effort, as with a smile he jumped into a compartment occupied by a young fellow, morosely sitting in one corner, and smoking.

'Mr Greig, I believe?' said Carson, scanning curiously the other's face.

He started; but was not unusually disconcerted as he replied: 'That is my name. But I—really—I really don't recall your name!'

'Carson—Elijah Carson. You don't know me. I am sent to bring you back. There is no help for it. Take care what you say; you are not bound to criminate yourself.'

'Carson the detective?'

Carson nodded affirmatively.

'What is wrong, then? I am going to London; and I don't recognise your right to prevent me. I have debts; but they are not legal debts, if that is what you are after.'

'Pooh! that is nothing. This morning, Mr Anthony Greig, of Greig & Co., Limehouse Street, was found in his office, dead.'

The look of utter dismay that covered the young fellow's face was no effort of a guilty actor to counterfeit surprise. 'My uncle dead!' he exclaimed.

'The lad's no more a murderer than I am,' thought Carson, as he scanned the pale and discomposed countenance before him. 'Come, come,' he said aloud; 'men have been murdered before this. The question is, Who did it? I don't mind telling you that your disappearance led to suspicion; and as soon as I could find your intended route, I went off after you.'

'Murdered!' groaned the lad, as the pair quitted the train and slowly retired from the platform. 'I know nothing of this.'

'Ay, that is the word; though there is just a chance it was suicide. Now, listen, and take my advice. If—mark, I only say if—you did it, keep your own counsel; you will have enough to stand against without my evidence. If you are innocent—well, you needn't swear to it now—give the clearest possible account of your doings since yesterday. Tell your solicitor everything; and if you like to trust me—he offered his long nervous hand as he spoke—'if you like to trust me, my lad, I am your friend. First impressions count for a good deal in these cases; and mine are, that you are all right.'

Greig warmly grasped the offered hand. 'Thanks,' said he. 'I have nothing to conceal. I quarrelled with my uncle yesterday about my debts; betting, you know.' (Carson nodded.) 'I suppose that is why, when I disappeared, I was suspected. Oh, my poor uncle! I was his heir—my cousin Grace and I. He told me so. Why should I have been such a fool as to vex him as I did?'

Carson frowned. 'You know you are his heir, you say? Nothing, no money or valuables were stolen; your knife was found on the desk; you have a key of the office; no violence has been done to the premises. All this looks very bad

against you. Now, collect yourself. Where were you yesterday and last night? Who saw you? Account clearly to me for the time spent since you left your uncle. And don't tell me, I warn you, for your own sake, anything but the facts.'

'I'll tell you just what I did. After the scene I had with him in the morning, I walked out of the office—I don't know where; but I know I got to Allenton Hotel, and got some dinner there. I could not go home, and I went back to Limehouse Street at six o'clock, and waited for him to come out. But he stayed late.' I waited, I should think, more than an hour—yes, two hours, for I remember eight o'clock striking. I was walking up and down; and at last, when I came in view of the window again, it was dark, and as no one came out, I thought I had missed my uncle. Then I walked fast homewards, to overtake him'—

'Did you see nobody, or rather did anybody see you, whilst waiting outside?'

'O yes. Several of the workpeople passed. Tim, the man with one arm, who was hurt by the machinery, passed me; and so did Morris the cooper.'

'Notice you?'

'O yes. "Good-evening, Mr. Anthony," or something of that kind, they said.'

'Well, you were saying you walked home'—

'Yes, very fast, to overtake him—my uncle. I wondered at still missing him, and was much annoyed. I would not go in. I saw Robert—Mr. Slater, I mean, the solicitor—leave the house; but I avoided him; and then I went to a friend's place, James Beesley, in Harrington Street; he has apartments there. I stayed with him all night, and told him my difficulties.'

'Of your own accord, or did he ask you?'

'Oh, he asked me. He asked me what was the matter with me. And then I told him of the scene I had had; and that I was going to clear off to London, and stop that atrocious betting.'

'Does your friend, Mr. Beesley, bet?'

'O yes. I told him to let our friends know I had decamped. It's shabby, I know; but what else was there for it? After all, it's only a rough-and-ready way of bankruptcy.'

They were by this time on their way back to where the unfortunate young fellow was to be lodged for the night, pending the coroner's inquest next morning. Little more passed between the two, except that occasionally Carson asked a question as he ruminated on the various bearings of the case. He was convinced the young man was not trying to deceive him; but he could not help wishing that the jury who would try the case had seen the lad's face on first hearing of his uncle's death. The world at large judges by facts, and not impressions.

v.

On the morning after the body of Anthony Greig had been found, the inquest was held, and his nephew was arraigned as the suspected murderer of the old man. After the usual preliminaries of inspecting the body, and the like, evidence was led as to the circumstances under which the deceased might have met his death; and notwithstanding the keen cross-examination of witnesses by Mr. Slater, on behalf of the young

man placed at the bar, the evidence all pointed in one direction, namely, the implication of young Anthony Greig as the murderer of his uncle. The quarrel on the previous day between the uncle and nephew was spoken of, and the threat repeated with which the young man was heard to take leave of his relative. Tim, the one-armed man, and Morris the cooper, bore witness to the fact that they had seen the accused loitering about the works on the evening of the murder, and that shortly after he had disappeared, the light in his uncle's room was seen to have been put out. They had naturally thought that young Anthony was simply waiting to accompany his uncle home; and it was not till they had heard that the young man's knife had been found beside the body of the deceased, that they remembered that the accused was seen by them as stated. The two men gave their testimony with evident reluctance, as young Anthony was rather a favourite among the workpeople; but the evidence was too clear to be set aside, and the jury had no hesitation in committing the young man for trial on the capital charge of murder.

While the final formalities of the inquest were being proceeded with, Mr. Slater sat at the table with an anxious and thoughtful look upon his face. No doubt, his thoughts were away with the daughter of the dead man, whose natural anguish over her father's lamentable end would be heightened and embittered by the thought that her own cousin, who had lived under the same roof with them, had evidently been the guilty instrument of the old man's death. Mr. Slater had seen Miss Grace that morning, and had assured her that nothing would be left undone on his part to clear the name of her cousin from the awful charge that lay against it, as both of them were convinced that, whatever differences may have existed between the old man and his nephew, the latter was utterly incapable of the crime of which he was suspected. But now, after hearing the evidence that had been led, the young lawyer was somewhat staggered and shaken in his belief in the innocence of young Anthony; and as he recalled to mind the succession of blackening circumstances which linked the accused with the crime charged against him, he felt that any attempts to save him would be all but hopeless.

As he sat thus, his eye fell upon the various articles produced at the inquest, and now ranged upon the table, having to do with the condition in which the body of the deceased was found; and among these was the white-handled pocket-knife, stained with blood, which had belonged to the young man accused of the crime. It was one of the fatal links in the chain of evidence against him. But there were other articles likewise blood-stained, and among these was a sheet of paper on which the old man had written the date, preliminary to commencing a letter to some correspondent or other. The letter was never written; for the hand of the murderer had clutched him then, and the sheet was now dabbled with the life-blood of the unfortunate old man. With a kind of morbid curiosity, Robert Slater put out his hand and took up the letter. As he looked at it, his eye assumed its wonted clear and eager expression, and for a moment it seemed as if he was about to rise and request the coroner to stay pro-

ceedings. But second thoughts were apparently against this, and he kept his seat. In a few minutes the Court rose, and the young man at the bar was led away in the custody of the police, to await his trial at the next assizes.

As the people were leaving the court-room, Mr Slater leant over to Carson the detective, whispered something, and pointed with his finger to the letter which he had just been examining. Carson, so incited, took up the paper, and placing it among the other articles, carried the whole with him out of court.

The young lawyer followed closely at his heels. When they had reached the detective's private room, the latter laid down the articles which he had carried thither, and singled out the letter to which Mr Slater had directed his attention. He looked at it scrutinisingly for a few minutes, and then turning to the lawyer, said: 'I see nothing here of any consequence. There are various blood-stains on the sheet, but nothing which seems to point to anything particular.'

Mr Slater took the letter in his hand. 'Do you see that blotch, as if made with half-dried blood?' he asked, pointing to a large oval stain near the inner edge of the sheet of paper. 'Well, don't you observe it is the impression of a man's thumb? It is that of the left hand, if I mistake not. See, there are the grooves or furrows of the skin distinctly marked; and if you open up the double sheet you will find a similar finger-mark on the reverse side. But the latter is not so well defined as the print of the thumb; and I think this will be of use to us.'

'I see what you point out,' said Carson; 'but what purpose can these markings serve?'

'I will tell you,' said the lawyer. 'Just the other week I was reading in a scientific journal that the arrangement of the grooves or furrows on the skin of the finger, shown in such an impression as this, is not the same in all men, but that every individual may be distinguished by the characteristic markings thus obtained. In China, for instance, all holders of public offices, and especially soldiers, are known by their finger-mark, and several cases of crime and desertion have been detected by reference to these marks. Besides, when any one possesses the finger-mark of any individual not otherwise known to him, it is found to be impossible for another man to personate that individual, because a comparison of their finger-marks would at once detect the deception.'

'But how will this serve you in this case?' asked the detective, naturally cautious as to admitting the force of evidence of such a novel kind.

'In this way,' said Mr Slater. 'We must take means to get the finger-mark of every man in the establishment of Greig & Co., as also that of the deceased man, and of his nephew. This can easily be done; and thereafter, by an idea which has occurred to me, namely, by photographing each impression, we will arrive at the fact whether or not any one of these marks agrees with the mark on this sheet of paper. Meantime, the utmost secrecy will be necessary as to our intentions, so that none of the workmen take alarm, and escape us.'

'But why,' said the detective, 'should the workmen be specially singled out, and not the clerks also?'

'Because,' answered the lawyer, 'I am all but certain the two impressions on this sheet of paper have been produced by the finger and thumb of a man who uses tools, and has a hard hand. The furrow-markings are broad and flattened, and the great size of the thumb is extremely noticeable; and by these together I am led to think that we have got a clue to the person who committed the murder, and that that person is not young Anthony Greig, however darkly circumstances may appear against him at present.'

## EQUAL TO THE OCCASION.

To be equal to the occasion, is undoubtedly a natural gift, and there is apparently no royal road to its attainment. The possessors, however, of such an inestimable blessing are somewhat few and far between. Without a doubt, many of us can refer back, not perhaps without feelings of regret, to more than one occasion on which we might have made a very appropriate remark or observation—only, we didn't think of it at the time. When we did think of it, it was too late; we had allowed the golden opportunity to slip by; in fact, we were not equal to the occasion.

To be equal to the occasion, admits of no particular length of time for thinking, or beating about the bush for an answer; the reply, to have effect, must be almost instantaneous. Some years ago, when the seas were infested by a lawless crew, the captain of an English vessel sailed from a Spanish port with a number of passengers aboard, and among them was a timid Frenchman, who evinced the greatest fear lest the vessel should be taken by one of the Saltee rovers, and they should all be made slaves to the Moors. 'Don't you be at all alarmed, my good sir,' cried the captain; 'for before I'd allow my ship to fall into the hands of those confounded piratical rascals, I'd blow her into the air.' Unfortunately for us, the account closes here; otherwise, it would be highly interesting to learn, whether the nervous foreigner altogether approved of this ingenious plan of escaping from the clutches of these marauding gentry. It was an instance, however, on the part of the captain, although rather startling in its character, of being equal to the occasion.

In the *Antiquary*, the learned Mr Oldbuck asks his gallant nephew whether the men of his regiment would not feel renewed heart and courage if, at the close of a toiling day, they found they were bivouacking near the tomb of some famous hero. The answer of the young soldier was not only amusing, but exhibited an amount of forethought not often met with. 'My conviction is,' said he, 'that they would feel not only more encouraged, but much better pleased, if they found themselves near a poultry-yard.'

There was once a soldier in the army of the Duke of Marlborough who, taking the name of that distinguished General, was severely reprimanded for it. 'How am I to blame, General?' said the soldier. 'I had the choice of names, and I selected the one I now bear. If I had known one more illustrious than yours, I should have taken it.' What, really, could the gallant General be expected to say, in return for so flattering an admission?—why, merely this, that the man was equal to the occasion.

Indeed, the army affords numerous instances of

promptitude in words as well as actions, military command and discipline occasionally requiring it. It may be sufficient, however, for our present purpose, and by way of illustration, to introduce those only of a somewhat humorous character.

A young ensign residing in lodgings the rooms of which were very small, was visited by a fashionable friend, who had no sooner entered the apartment, than he exclaimed: 'Why, Harry, old boy, how long have you lived in this diminutive nutshell?' 'Well, my dear fellow,' replied the other archly, 'I am sorry to say, not quite long enough to become a kernel.' To use a military phrase, the above might be termed the 'light artillery' of conversation. Equally as good was the reply of a private of the Galloway Rifles, who was standing sentry, when an officer, noticing that he had a bruised face and an unmistakable black-eye, accosted him, and charged him at once with having been fighting. 'Please, sir,' replied the soldier, 'I believe it was principally for that, that you specially engaged me.' Dry humour such as this is seldom met with; and we are disposed to conclude, that the officer, if not a rigid martinet, would decide not to pursue the inquiry further, but would treasure up the smart reply, as a joke for the camp in general, and his own private friends in particular. To us, it may recall those famous lines by Herbert:

All things are big with jest; nothing that's plain  
But may be witty, if thou hast the vein.

It may not, perhaps, be generally known that our heavy troops at the battle of Waterloo had no defensive armour; but soon after, a Committee of the House of Commons sat to consider the best sort of costume necessary for heavy dragoons and such-like, when a stalwart lifeguardsman who was under examination, on being asked what armour he should like to adopt on another similar occasion, replied: 'Well, gentlemen, if you ask my candid opinion, you can have it at once. I think I should certainly prefer, if called upon to do duty again in a like manner, to put in an appearance in my shirt-sleeves!' This quite upset the gravity of the assembled conclave; and the subject remained in abeyance for some time after.

To the Army, the Church, and the Law, we are principally indebted for various whimsical examples. We have read of a celebrated man, a very popular preacher, who, a few years ago, was asked to lash the prevailing folly, the 'invisible' bonnet. He did so, as follows: 'I have been requested to rebuke the bonnets of the present day.' At this startling announcement, one might have heard a pin drop. Wandering thoughts were immediately arrested; and scanning the ladies of the congregation, he added: 'But really, I see none!'—a more bitter rebuke than any other words could possibly have conveyed.

'Tom Brown' tells us, a divine ought to adapt his sermon as an astronomer does his almanac, to the meridian of the place and people where he lives. So thought, evidently, a French priest, who had usually a very small modicum of hearers. One day while preaching at the church in his village, the doors being open, a gander and several geese came stalking and cackling up the middle aisle. The preacher, availing himself of the circumstance, observed that he could no longer

find fault with the people of his district for non-attendance; because, though they did not think proper to come themselves, they were thoughtful enough to send their representatives.

It was a saying of Lord Brongham's, that a lawyer was a learned gentleman who rescues your estate from your enemies, and keeps it himself. The following may be considered a specimen of a lawyer being equal to the occasion. A gentleman, while bathing in the sea, saw his lawyer rise up at his side, after a long dive. After an exchange of salutations had briefly passed—'By the way,' said he, 'how about Gunter? Have you taken out a warrant against him?'—'He is in quod,' replied the lawyer, and dived again, showing his heels as a parting view to his client. Nor did the latter hear more of the interview with his lawyer until he got his account, which, amongst other matters, contained the entry: 'To consultation at sea, anent the incarceration of Gunter, six and eightpence.'

On the bench, the notorious Judge Jeffreys talked fluently and with spirit; but his weakness was that he could not reprehend without scolding. His voice and visage, too, made him a terror to real offenders, and formidable indeed to all. Pointing with his cane to a man who was about being tried, he said, somewhat excitedly: 'There is a great rogue at the end of my cane!' The man to whom he pointed, looked at him, and coolly asked: 'At which end, my lord?' His lordship seemed petrified. The prisoner was equal to the occasion.

Bishop Horne used to say: 'It is expedient to have an acquaintance with those who have looked into the world; who know men, understand business, and can give you good intelligence and good advice when they are wanted.' A couple of lawyers engaged in a case were overheard discussing the issue. 'At all events we have justice on our side,' said the younger and more enthusiastic lawyer—'in this, I think, is something irresistible, and needs nothing to help it out.' To which the senior counsel replied: 'Yes, yes; that's all very well in its way, and perfectly true; but what we really want is the Chief-Justice on our side.'

Now and then will occur a play upon words or names, and in this as in everything else capable of exciting hearty laughter, there must be absurdity. Mr Justice Hayes, as is well known, was a wit. On the trial of a cause of 'Woodcock v. Bird,' before Lord Chief-Justice Jervis at Warwick, the Chief-Justice having remarked that it was a pity that two 'Birds' should not live in harmony, Hayes replied: 'Yes, it is, my lord; but my client complains of the length of the plaintiff's bill!'

There is no action in the behaviour of one individual towards another, of which human nature is more impatient than of contempt, it being a thing made up of these two ingredients—an undervaluing of a man upon a belief of his utter uselessness and inability; and a spiteful endeavour to engage the rest of the world in the same belief and slight esteem of him. It is related of a negro minstrel that, being examined as a witness, he was severely interrogated by the attorney, who wished to break down his evidence. 'You are in the negro-minstrel business, I believe?' inquired the lawyer. 'Yes,

sir.—‘Is it not a rather low calling?’ demanded the lawyer. ‘I don’t know but what it is, sir,’ replied the minstrel; ‘but it is so much better than my father’s, that I am rather proud of it.’—‘What was your father’s calling?’ ‘He was a lawyer, sir.’ The learned man asked no more questions.

It was Milton who said: ‘Prudence is that virtue by which we discern what is proper to be done under the various circumstances of time and place.’ Of a certainty, there are those who do not lose their presence of mind, or appear in the least way disconcerted, or even intimidated, by obstacles that occasionally crop up in the daily course of life, but remain perfectly cool and passive under the worst of mishaps. In an opera, Beard, a celebrated singer, had to look towards the side and say: ‘I see him approach this way;’ but unfortunately, the person expected was not forthcoming. Beard, in order to give his friend time to go round, came forward, and pulling out his watch, said: ‘No; I am mistaken; it is another person; in fact, it wants one minute to the appointed time. I know he will be here; for he is ever punctual.’ Not a creature detected the liberal finesse save the prompter.

Sometimes we are surprised not only to hear, but to learn something from a quarter where we should have least expected it. By the statute 6th George II. c. 37, it was made felony, without benefit of clergy, to destroy an ash-tree. Dr Ash, a great wit and intimate friend of Swift, was once wet through with the rain, and upon going into an inn where he was well known, asked the waiter to take off his coat for him; upon which the waiter started, and politely refused to do anything of the kind, for, said he, ‘It is felony, sir, to strip an ash!’ The Doctor used to say he would have given fifty pounds to be the author of that pun. The waiter was equal to the occasion.

## PAVEMENT PORTRAITS.

### A SPIDER.

A HARMLESS-looking, quiet, little gray man, carrying an innocent sort of reticule, may be observed on many a fine morning, ay, and on many a stormy one too, tripping daintily along Pall-Mall, along Cockspur Street, by Charing Cross; and then to the right, down Whitehall. Muttering to himself as he goes along, it is evident that his thoughts are introspective, and that the ‘throngs of men’ among whom he moves at this busy hour interest him not at all. Not by any means a remarkable man is this portrait. He is below the middle height, is dressed in respectable speckly ‘Oxford mixture,’ his trousers and his comfortable double-breasted overcoat being of that semi-clerical tint. He wears a tall hat, nicely brushed, with a narrow hat-band which lends a tinge of subdued melancholy to his appearance. He has spotty-gray cloth gloves of robust make on his hands, one of which carries a substantial umbrella, while the other holds the reticule alluded to. His face is rather benign, and not ill-favoured, except for his eyes, which look as if they never closed in sleep, so restless and sharp are they. His hair is like his

clothes, of an undecided gray; his whiskers of the same colour, are well trimmed, and cut so as to nearly meet under his lower lip, as if the right and left sides, hastening to greet each other in a cordial sort of way, were stopped by the little round chin, on which not a hair is allowed to grow.

Down Whitehall he walks. The carriage of the First Lord, as it drives sharply through the gateway of the Admiralty, arrests him for a moment in his progress; but the stoppage does not cause him to show any interest in the vehicle or its occupant. The blazing mounted sentries at the Horse Guards do not secure a glance from the restless eyes of the bearer of the black bag, who continues his sharp little trot until he reaches Downing Street. Here he turns the corner, and going a few yards up this quiet retreat of Diplomacy, stops, and takes his stand on the curb-stone. He plants his umbrella firmly down, and gazes in a placid way at the highly ornamented façade of the Home Office opposite.

Not a minute has elapsed after the arrival of the spider, ere the fly appears. Out from the grand doorway of a government office close at hand comes a fashionably dressed young gentleman, with a rosebud in his coat, and a slight flush on his cheeks—not exactly a flush of health, but rather a blush of perplexity and shame at the business he has in hand with the speckled smug at the corner. Turning sharp to the right, he walks, with a step rather too light and independent to be natural, straight to the sacrifice about to be made, in which he himself is to be the victim, the bag-carrier the executioner and priest.

The latter draws his chubby, white but plebeian-looking right hand from its hot cloth case, and gives four fingers to the victim, on whom he smiles complacently as he says: ‘Good morning, Mr ‘Ampton’—he is sparing in the use of the letter *h*—‘ow are you?’ As he asks this simple question with ‘a smile that is pensive and child-like,’ his restless little red eyes wander along the street, and across the great broad road of Whitehall to the distant Mansard roof of Montague House, as though for a moment he thinks that he has mistaken his *métier*, and that his *rôle* in life should have been that of an architect, instead of that of financial agent to government office fledglings, whom, to do him justice, he plucks ere even they have strong feathers for pulling.

A commonplace answer to his commonplace question having been given, the roaming eyes return home from their journey across the road, so to speak, and their owner’s gaze suddenly takes a higher flight, over his companion’s right shoulder in an oblique direction, as he says in a gentle nervous tone: ‘Ow about those tickets for the theatre, Mr ‘Ampton?’

‘I’ve told you, Mr Jackson, a hundred times, if I’ve told you once, that I never have orders for the theatre. When I go, I pay, and I am not in the way of getting tickets for free admission. I

know lots of fellows *do* get them; and I am sure some such fortunate beggars must be in your book, so that it is not necessary for you to come to me for such things.—Well now, you got my letter yesterday, I see; can you do what I ask?

The fly has come to the point with a rush. He already begins to feel rather uncomfortable, and he wants to cut the interview short, albeit he dares not look at the spider, but busies himself with arranging the flower in his button-hole, which gives the spider an opportunity to cease for a moment his study of the clouds, and allow his eyes to 'take in' the young man before him on their way downwards from space to the square of pavement immediately in front of his golosh-covered feet.

Then the gentle executioner draws a little diagram on the ground with the point of his umbrella, and speaking more to that Gampish article than to his interrogator, says: 'Well, you know, Mr 'Ampton, there's a little interest on that last bit of paper. It isn't much, and I daresay we can arrange it comfortable for you; and I have brought a fresh one that you can take in and sign. It's all right. I've put it all together, so as not to make any confusion. I've got so many little affairs with my friends when one bit of paper can show at a glance 'ow we stand. There now, take it, and look at it. I'm not 'ard on anybody. You'll be satisfied, I know.' Here the little man puts his umbrella under his arm and opens the bag—that receptacle which holds blood in bonds, young men's sighs, tears, and curses hidden behind the signatures hastily scrawled on the oblong slips of ominous blue paper!—and produces two of the slips, which he hands to the impatient client. 'Ere they are, Mr 'Ampton. That's the old—you see I've entered the interest you paid me last, on the back—that, you see, is for forty. Now, suppose we say I'll let you 'ave five, and you take up the old bit o' paper, and sign this new one, and then we'll be all right up to date.'

'But this bill, my dear sir, is for fifty!' exclaims the other, 'and I asked you for ten. Am I to sign for other ten pounds and receive only five? Oh, this is too much! I can't do it, I really can't.'

'But the interest, Mr 'Ampton, the interest, in these 'ard times! You'll find it all correct, if you just go in and work it out, Mr 'Ampton. I'll go and take a walk on the Embankment, and I'll come back in ten minutes, and then I know you'll see that I'm not 'ard upon you. I wouldn't be 'ard on any one for anything.'

'Oh, well, make it seven then, and I'll sign,' says the victim, who makes an effort to get something nearer what he requires for the sacrifice which his signature will carry with it.

'Five-ten.' This in the blindest way, with a sudden look of interest in a statue stepping out of a niche in the building opposite.

'No; six pounds ten; not a penny less—and then I'll see whether I can get any orders for the theatre.'

'Now, Mr 'Ampton, Mr 'Ampton, you are really too bad. I can't *give* money away. I tell you what I'll do—I'll *say six*.' This last offer is actually accompanied by a gentle dig administered by

the spider to the fly on the middle button of the latter's frock coat; and a sort of little ricochet movement on the part of the former, as he looks straight at his victim for the first time.

'All right, then; six;' and away flies the fly to sign the new paper, which he soon brings out again; upon receiving which the financier produces a little chain purse, from which he extracts six sovereigns, already done up in paper, which he hands to the victim, saying: 'You won't forget the tickets, will you?'

'Oh, all right. Good morning.'

'Good morning, Mr 'Ampton;' and the sucked one goes off to his ten-to-four duties; while the sucker goes on to the Embankment to look at the penny steamers and to admire the flowers!

Nature is full of contrarieties; otherwise, it would seem odd that an awful little money-grubber such as the subject of this sketch should take pleasure in the growth of trees and flowers; but so it is. This man, who, like a veritable vampire, exists on the blood of his victims, is quite an authority on roses! He has ninety-nine different kinds of this flower, which have bloomed and withered year after year in the money-lender's garden at Wimbledon. Prizes have been gained by him at local flower-shows, where his roses have competed with those of the honest merchant and the unsophisticated local magnates; and his cleverness at rearing them is often the talk of the gardeners of the neighbourhood. Works of art too are collected by this sixty per-cent. monger; and on the walls of his vulgar little villa hang 'bits' by Copley Fielding, 'old' Chrome, and Clarkson Stanfield; while copies of the antique in statuettes stand upon his shelves. This man knows the money value of all these possessions; but we doubt whether they give him pleasure in any other way. For had he any real perception of what is beautiful and good, how could he sit among these things evening after evening, as he does, weaving the meshes in which he chains his victims, manufacturing gyves, and with his iniquitous per-cent. exactions, arranging racks as heavy and as cruel as those of Torquemada and the Inquisition of old?

The man is not pleasant; and it would be well if it were possible to shut him up for ever with his roses, his canvases, and his curiosities, so that he might cease to trot round public offices, where his presence is as deadly as the breath of typhus itself.

#### THE ENGLISH AVALANCHE OF 1836.

In the year 1836, there happened a calamity which created a considerable stir throughout England. An avalanche which then occurred brought the same devastation to property and life as we are apt to consider peculiar to the lands of perpetual snow. The town of Lewes is known more or less to most travellers, and was the seat of the disaster. It is bounded by the South Downs. A part of the range is detached, and known by the name of 'Cliffe Hills,' the height of which is about three hundred feet above the roadway, and the row of cottages built at the base. The ascent to this line of hills is by steps cut in the chalk at the back of the

houses; while on the other end of what is known as South Street, a pit, from which the chalk had been excavated, stands, and then stood facing the whole height of the hill. Over its edge, the snow had drifted, and accumulated in an immense mass, the wind having swept it thither from the hill-top, till it overhung the cottages in the street below. In its magnitude and purity, it presented an object of interest and beauty, and attracted great attention. But as this increased in bulk—from the continued drift, rather than from fresh falls—some apprehension was expressed lest it should become detached. Those, however, who were warned of their danger, as dwelling in houses immediately beneath this vast accumulation, appeared to be most stolid in the matter! It is ever hard for the ignorant to realise a thing unknown; and when an aged man was urged to move from his fireside, he made answer that he 'had not lived eighty years to be afraid of a snowball;' while another refused to make preparation for moving 'till the thaw set in.' Those who watched the spot did so with a growing fear; and many endeavoured to rouse those most concerned, to the fact that it was no longer safe to inhabit houses so evidently imperilled. But words of warning availed little; and no advantage was taken of the offers made by those who had rooms or buildings to spare, into which household things might be stored. Thaw was the only thing known, and in many cases the only way ever heard of, in which snow was 'done away with;' so folks were willing to wait, till their experience was increased by knowledge, or till they fell victims to the fool-hardiness they displayed.

On the morning of December 27, about ten o'clock, just as the habits of daily life were being resumed in that doomed quarter, the avalanche began to move downwards, and at last burst from the hillside in one fell swoop, in its descending force driving seven cottages from their foundation, and carrying them more than twenty feet from their original standing-place. Anxious thoughts concerning the fate of the inmates filled every mind, and a crowd soon collected. Order was at once taken; and many set to work, under guidance, to clear away the snow which covered the houses, which had been removed from their sites apparently intact. A high wall on the other side of the road, behind which, some thirty feet off, the river Onse had a back-water wharf, having been broken down, a place of refuge for the snow was thus secured. It is needless to enter into the state of confusion, the anxiety of relatives, and the strange characteristics which displayed themselves at the time. It is pleasanter to note how the emergency was met by 'master-mind' and 'ready-aid.' An ironmonger whose warnings had been unheeded, was most prompt in putting his stock of spades and shovels at the disposal of the workmen, who were soon enrolled as volunteers, under able captaincy. Those who were so employed have been heard to say, when telling the story of the memorable event, that they never could have worked if they

had not been 'obliged to mind what was said.' They were unnerved and sickened when they came to the body of a neighbour. Sometimes faint groans were heard directing their labours; and on this being known among the crowd, the anxiety of those who had missing relatives found vent in some fresh outburst. It soon became evident that the houses were completely crushed in at the back; and it was found that the sloping roofs added much to the difficulty of extricating those who were found to be pressed under the timber and debris.

The neighbouring workhouse furnished without any delay, blankets, stretchers, and whatever was needed; and thither were also removed the bodies of the dead or injured. Every assistance required was there rendered by the medical men of the town, as well as by the nurses. But eight were dug out lifeless, ere the spot could be reached from which the groans proceeded; while the gloom of grief and the tension of excitement mingled and extended among the workers, the relatives, and all who were there assembled.

The old man who had refused to take warning was the first discovered; he had been apparently suffocated, and had never moved from the chair in which he sat when he was vainly warned a short time before of the coming catastrophe. A woman had with some difficulty been persuaded to leave her house with her two children, and she then insisted on returning again 'for a shawl to wrap her baby in.' On being expostulated with, she said: 'The snow won't fall in that minute.' She re-entered her house, and was crushed beneath its ruins; but the baby that was the object of her care, was removed unhurt from her bosom. This incident, which formed a part of the detail of newspaper record, attracted the attention of a lady known in that day as a popular writer (the Hon. Mrs Norton), and she instituted inquiries as to the correctness of the statements; and finding them satisfactorily answered, she made arrangements to adopt the child whose early days were so romantically tinged.

But to return to the scene of the catastrophe, where active labours were carried on throughout the day. It had been one of the objects to ascertain how many were really missing. The evidence of neighbours had to be taken by those who acted as superintendents of the workmen; and fifteen was the number of persons found to have been in the houses at the time of the avalanche. By four P.M., when the light of the winter's day had well-nigh gone, fourteen had been extricated, and then faint groans were again heard, telling that the fifteenth was still alive. It now became necessary to reverse the order of working; for it was seen that a mass of snow still remained at the top of the hill, from which that already fallen had become detached, and that this was also threatening to come down. The snow from the broken houses had therefore to be thrown against the hillside instead of into the river, in order to break the force of that which was expected to fall. A relay of watchers was hereupon employed to take the signals given by those who were on the top of the hill, and pass the signals to the workmen who might otherwise be buried under any fresh downfall. Scarcely had the word 'Run!' been shouted, than a second mass came thundering down, enveloping some in thick snow, or

well-nigh blinding them by the rebounding particles; but happily no more serious incident occurred. Others came immediately forward; and soon the last of those buried was discovered, still alive, but much injured. He was a lad of about fourteen years old. The ruins of the cottage that had been his home had bruised him severely, and a rafter which had fallen on his leg, had broken it in two places—yet no vital part was injured. As soon as his head was uncovered, he pitifully cried for something to drink. Before he could be released from the position in which he had been buried for nearly seven hours, the rafter had to be sawn asunder; an operation that caused great anxiety, from the fear that the removal of the timber might cause a heavier portion to press on his chest, and deprive him of that life to which he seemed about to be restored. At last, in a state of extreme exhaustion, he was released, and taken to the workhouse. One little child, beside that already mentioned, escaped uninjured. Five had fractured limbs or severe bruises. Eight were killed, and those were buried in the churchyard of South Malling, an outlying parish of the town of Lewes, where a marble tablet in the church thus records the event:

This Tablet is placed by Subscription, to record an Awful Instance of the Uncertainty of Human Life. On the Morning of December 27, 1836, the poor houses of this Parish were destroyed by a Mass of Snow falling from the Hill above, and the following eight Individuals were buried beneath the Ruins: William Geer, aged 82; Phoebe Barn-dur, 45; Mary Taylor, 42; Susan Hayward, 34; M. A. Budgeman, 28; Jane Boaks, 25; Joseph Wood, 15; Mary Budgeman, 11. Their Remains are interred on the north side of this Church. 'Be ye therefore ready also: for the Son of man cometh at an hour when ye think not.'—Luke xii. 40.

The funeral, no less than the catastrophe that caused the deaths, is still riveted in the memories of the older dwellers in the neighbourhood. As the snow still continued to obstruct the roads, a deep cutting was made for the wagons which took the usual place of hearse in melancholy cortège. Sorrowful as the circumstance appeared to all, thankfulness from the first was expressed that 'the fall' was not in the night; for though the danger had been pointed out to the inmates of the ill-fated cottages, above forty persons had slept in them; and marvellous escapes were recorded of those who were away at the time. One woman often has told how she was called from her 'washing-up' to see how beautiful the snow was on the top of the hill; but after walking across the road, she had not time to turn round and look up, for she was pushed forward by the falling mass. Thus narrowly did she escape the fate of kinsfolk and friends.

Voluntary contributions of nearly four hundred pounds quickly placed a fund in the hands of 'Directors,' which enabled them to grant assistance to the families of the sufferers, and to carry on the exploration of the ruins. The clearing away of the debris revealed the fact, that among some of the residents an attempt had been made to keep Christmas as a festive season. Pieces of cake, pudding, and other eatables were scattered among earthenware, apparel, bricks, and broken

timber. Nearly all the furniture was damaged. This was collected, and placed in an empty house, where owners were invited to see if they could identify their own possessions. Many articles, spliced and repaired, remain valued as relics, and serve to recall the sensational episodes that occurred at the time of the great English Avalanche of 1836.

#### S N O W.

WRAPPED in a dead, deep silence lie the moors,  
Beneath their shroud of white. Unbroken calm  
Reigns o'er the wide expanse, whose deadness seems  
The very grave of life!

The leaden sky  
Teems with its snowy burden; 'mid the furze,  
With this fair, pure, white penthouse overhead,  
Crouch the packed moor-fowl and the shivering hare,  
In that instinctive fellowship which comes  
Of common hardship—each intent to find  
Some scanty fragment for a needful meal.

Here, with knit brows, courageously, along  
The scarce-distinguished path, the shepherd plods,  
Now glancing upwards at the threatening sky,  
Now scanning, for some wanderer from his flock,  
The landscape round; and ever and anon,  
To keep his spirits up, he whistles loud  
Some tune discordant, as he picks his way.

And see! Upon the sombre forest-lands,  
The tall, gaunt trees stand forth like sentinels  
Around a slumbering camp; their meagre arms,  
Swayed by the wind, the gathered snow-flakes shower  
In powdery softness down.

The lowlands lie  
Hidden beneath their snow-dress; scarce a fox  
Or rabbit is astir; the famished birds  
Nestle within the ivy that enshrouds  
The farmhouse walls; the cattle all are stalled  
Warm in the byre; and in the straw-yard crowd  
Together the plough-horses.

Snow, snow, snow,  
On moor and wold, on woodland, and in glade,  
On city-roof, on country-cottage thatch,  
Winter's 'regalia,' crisp, bright, sparkling Snow!

## LONDON SIXTY YEARS AGO.

OUR broad sanded beach is alive with multitudinous waves, avant-couriers of the storm now merrily raging in the German Ocean. The wind has worn round due east since mid-day, and the force of it has increased hour by hour, until now, at nightfall, it is blowing half a gale. All other noises are hushed in the ceaseless roar of wind and wave. Fitfully through the foaming mist, the red lights of the Guard-ship gleam like huge carbuncles, in reply to our own brilliant disk in the lighthouse at the mouth of the river. The spindrift, rent in shreds by the driving blast, flies through the upper air in tatters. No rain has fallen as yet; but the wind-borne spray of the conflicting waters descends in showers of thin vapour, which quickly penetrates the thickest garment. Out yonder on the jetty and alongside the outer edge of the esplanade may be discovered sundry fishermen, completely clothed in tarpanlins—looking like massive blocks of polished jet—making fast their small craft in safe anchorage. It is indeed a wild night. Closing the heavy shutters, I draw the curtains and make all snug. Familiar with the storm and its tempestuous riot, I draw my chair nearer to the blazing fire, where, amidst the fumes of the thrice-blessed weed, I dream of home—the dear old home of my childhood. No longer sensible of the freaks of 'rude Boreas,' I gently subside into quiet contemplation of old scenes and old memories, of tender hearts and sweet companionships.

I am dwelling, in memory, in an old red brick London mansion, built in the reign of the Third William. It is situated in a courtyard in one of the lanes leading from Lombard Street to Thames Street. Originally erected for the occupation of some City magnate, it still bears the impress of massive respectability. The walls of every room in the house, from the hall upwards, are covered with dark oak panelling. The principal apartments on the first floor, including the staircase, have painted ceilings; and the floors consist of coloured woods inlaid to various pat-

terns. The stairway leading to these is ten feet wide, furnished with a huge hand-rail and mighty balusters. The cellarage is co-extensive with the foundation. Taken altogether, a fair specimen of the kind of habitation our not very remote ancestors affected.

Here, now, within two hundred yards of the sounding sea, I can recall vividly the dimensions and outlook of the little room in the upper story that I occupied as a bedchamber; the low pitched roof having a large supporting beam, which passed across the ceiling; the two iron lattices filled with diamond-shaped pieces of glass in a framework of lead; the seats under the windows with hinged tops; and over and above all, the blue glazed Dutch tiles, fastened in each jamb of the fireplace, illustrating the histories of Joseph and his Brethren, and of Abraham and Isaac. Here, in the quiet hours of the night or early morning, I have lain awake, listening to the chimes in the tower of the old Royal Exchange, as they broke into the well-remembered tunes of *There's no Bed about the House*, or the *Roust Beef of Old England*. Sometimes the faint cry of the neighbouring watchman calling the hour, would creep up to my airy resting-place, as I lay bewildered and half frightened. I call to mind also the mortal dread that used to possess me in my wakeful moments, if I heard a footfall in any of the passages leading in my direction. As the door had merely a latch, but no fastening, I naturally concluded that if any thieves should break into the house, my removal among other articles of value would be certain and immediate.

As these and other kindred associations well up in my memory after the lapse of so many years, it has occurred to me as a pleasant task that I should record, for the delectation of my children and my children's children, some of the more curious reminiscences of an earlier day.

To those who can recall the aspect, habits, and conditions of life in this our 'City' of London some sixty years ago, the change both in appearance and manners must of necessity be amazing. Even a cursory glance at a few of the alterations that

have taken place within that period, reminds one in some measure of the effect produced by a dissolving view, or the transformation scene in a pantomime. The larger number of our more prominent mercantile celebrities had become migratory; no longer resident in their houses of business, they had withdrawn either to the more fashionable locality of the west end, or to some pleasant suburb mildly suggestive of the far-off delights of the country. Still there were many remaining who did not disdain to dwell above the roomy warehouse or behind the well-stocked shop. Every seventh day our numerous churches were compactly filled with an attentive congregation: it being common ground on which the various classes of the community elected to meet for the performance of good offices and the exercise of civilities. As most of the inhabitants of the parish were known to each other, at least by sight, the meeting maintained its character as a friendly gathering met for worship, rather than that of a mere promiscuous assembly. On ordinary days, the men-folk were up betimes assiduously engaged in their various vocations; whilst the wives, with that indomitable pluck native to the sex, were not above turning up their sleeves and donning the large white apron, preparatory to the performance of their share of household duty.

We had no cabs, omnibuses, steamboats, or railways, the means of conveyance to any given point being limited to the hackney-coach, the wagon, the stage-coach, or the ferry-boat. Occasionally, on a summer evening, when the warehouse was closed and the shutters scenerily fastened, the master and mistress of the establishment would perhaps bend their steps to the water-side stairs at old London Bridge, Dowgate, Queenhithe, or Blackfriars, whence they could take boat for a pleasant row up the river as far as Lambeth, Vauxhall, or Chelsea, where there were pretty little taverns with gardens running down to the water's edge; and seats, provided with sweet climbing plants, the scent of which was grateful to the civic nostrils. (The watermen at this period plying on the Thames between the above-named bridges, were largely employed by the Fire Assurance Companies of the City to man their engines when attending the various fires, and as each Company supplied its own men with a distinctive uniform and badge—closely resembling the pattern of 'Doggett's' coat and badge—they presented a very picturesque appearance.) Or they might take the stage at the 'Pewter Platter' in Gracechurch Street, or the 'Flower Pot' in Bishopsgate, for a ride to Hackney, Homerton, Kingsland, or Tottenham.

For those who chose to pace afoot, there were the 'Shepherd and Shepherdess' fields, or the open ground about Highbury, even as far as Canonbury Tower. The south and south-eastern suburbs were not so much frequented by the citizens. The main artery leading to these districts was the Old Bridge, the approach to which was at the foot of Fish Street Hill, adjoining the church. The pathways were narrow and ill paved, and its roadway was always crowded with huge country wagons, cumulous carts, and hackneys. Every half-dozen yards or so, you were met with a cry of 'By your leave,' and thrust either into the carriage-way or against the

balustrades, to make room for the heavily laden porter. (Our 'porters' were at that date quite a class by themselves, not by any means to be confounded with their brethren who were licensed by 'ticket' for the delivery of messages or private letters. They were great in stature and strong of limb; and their usual employment consisted in the conveyance of heavy goods from one warehouse to another by means of a 'knot.' This was an article usually composed of hemp, tightly compressed into a pillow-like shape, with rounded corners; covered with canvas of the thickest kind, it was thrown on the shoulders and fastened round the forehead by means of a loop, which kept it in its place. By this expedient the bearer was enabled to carry his box or bale on a level with his head, thus giving him at once more ease and greater security. They had stations and 'houses of call' where they could be found at any moment; and the authorities, mindful of their laborious occupation, had fixed in all the principal streets a number of resting-places, each with this inscription painted over it: 'Do not leave your goods.') The Southwark side of the water once gained, you had to run the gauntlet of the Borough High Street, packed to repletion with market-carts and enormous wains, bound to or returning from the Weald of Kent or the South-western counties; so that it was not until you reached St George's Church that anything like a free passage could be obtained.

In all the contracted turnings that branched out of the larger thoroughfares, dirt and obscurity were conspicuous, especially after nightfall. Gas had but recently been introduced, and the Corporation had entered upon its use with timidity, looking at it more perhaps in the light of an experiment liable to failure, than as a predestined issue. To make our 'darkness visible,' we invoked the aid of oil and tallow. Under these circumstances, the 'lanplighter' became an important personage, an institution, in fact, not to be ignored. His duties consisted in keeping clean and replenishing the lamps committed to his charge. To accomplish this he carried with him in the early part of the day a supply of oil; a small can, to which was affixed a long thin tube; cottons, and a bundle of rags: which articles, together with a slender ladder, constituted his working apparatus. As the day waned, he would traverse the ground again with his ladder only, and a lighted torch, by means of which the wicks were ignited, and our illumination professionally secured for the night. The lamps were invariably fixed to the wall, the light itself being projected some eighteen inches or two feet over the path by means of a branch containing a circular socket, a specimen of which may still be seen in Ely Place, Holborn.

How to light a fire without the aid of a lucifer-match would be a very pretty problem for the present generation to solve. Fifty years ago, the secret was an open one, patent to everybody. My elder readers will not need to be reminded of the 'tinder-box' with its 'flint and steel.' For the information of my younger friends, I will venture to explain the process. First as to the 'box' and its contents. Imagine a small iron case about the circumference of a small cheese-plate, two inches deep, with a lid, but without a top; the lid being a size smaller than the box itself, to allow of its

resting upon the tinder at the bottom. The next step was to procure a piece of rag, or best of all a fragment of an old cotton stocking, which was held over the fire until it was nearly consumed, care being taken that the expiring blaze should be shed in the box, when the lid was quickly placed upon it, crushing the last remaining spark. Here then was sufficient tinder for a fortnight's use. How to procure a light from the charred remains, was a question to be discussed in the early morning before your fire could be kindled. Your 'steel,' which had a short half-circular handle, was a piece of metal about five inches long and one inch in width, ready either to receive sharp blows from the flint, or to deliver them. The sparks falling from the quick contact would set the tinder aglow, when, by the immediate application of a match tipped with brimstone (the Scottish *spunk*), the coveted flume was obtained. This was our primitive method of making 'the pot to boil' in the days when George IV. was king.

As the police force had not yet sprung into existence, the nightly safety of his devout Majesty's loyal subjects was placed under the immediate care and control of the 'watch.' Every city ward could boast of its 'lock-up' and its relay of constables; the supervision of the whole body of which was invested in a Committee held periodically at the Guildhall. The rank and file of these city guardians were generally selected from amongst the poorer inhabitants of the parish they were appointed to guard; and thus it was that they became familiarly known to, and were so long tolerated by, the home-dwellers in their several districts. The larger houses of business, banks, &c., invariably employed a private watchman, sometimes two, for their own special security. This fact was, of course, well understood by the chief constable, whose efforts for the preservation of peace and the protection of property could only be discovered in results. The staff at his disposal being none of the largest, he was unable to divert his attention to those localities more exposed to the noise of the drunken brawler, or the more serious depredations of the midnight thief. Indeed, under the best management, the materials of which the force was composed were so miserably inefficient that failure in the endeavour to gain the desired end was the almost invariable result. A vicious system married to a method of 'masterly inactivity' led to the introduction of Sir Robert Peel's police bill, with its cheerful reminder that we might now 'rest and be thankful.'

Admitting that the ancient 'Charley' was the father of the modern 'Bobby,' it must be confessed that the usual signs of parentage were rather remote. I doubt exceedingly, if the venerable sire could revisit the glimpses of the moon, or be brought face to face with the son begotten half a century ago, whether he would recognise him. Costume and manners have effected such a transformation that it would seem impossible. From recollection I will try to present you with a full-length portrait of 'our' watchman, who was a very fair type of his class. He was fifty-five years of age, civil, but unintelligent, much given to strong drinks, not tall, yet able-bodied, and fully possessed with the importance of his office; a slouched hat, not unfrequently tied under

his chin with a coloured handkerchief if the wind or rain was troublesome; clothed in a long gabardine, not unlike a modern ulster, he carried a stave, a rattle, and a lighted lantern similar to those used in stables. Thus equipped he started on his round, calling aloud the hour, and describing the weather, as thus: 'Half-past two in the morning and a cloudy sky,' or with such other addenda or embellishments he might deem necessary. If the monotony of this proceeding became too wearisome, or the elemental war continued to rage with unabated violence, he retired to his 'box,' there to enjoy the pipe of peace and the slumber of the just, until the neighbouring chimes recalled him to a sense of neglected duty, when he would start on his well-worn way retraced. A description of one of these shelters will suffice for all: imagine a movable wooden structure like a sentry-box, only that instead of being open in front it was furnished with two half-doors, and a seat inside. Whilst traversing the streets, the watchman left this securely fastened; but on his return the lantern was suspended in the space occupied by the upper half, in order that the casual wayfarer might be apprised that Justice was not dead but only slumbering.

In the matter of holidays we were not deficient: it is true that the 'red-letter days' of old so dearly prized were slowly passing away; but they had not quitted us altogether. Easter and Whitsuntide were still something more than mere names; and Twelfth-night, with its sweet memories of frosted cake, its coloured characters, and its game of forfeits, was yet an abiding joy. Or May-day, beloved by the sweeps, who, tricked out in lawdly finery, would parade the streets and indulge in grotesque dancing, while their maidens, also daintily attired, gathered coppers in long ladders which they carried for that purpose. Time's landmarks generally seemed to carry with them at least a lively remembrance, if not a strict observance. Birthdays were cheerfully recognised as a pleasant pretext for family reunions; the ties of relationship appeared to bear an additional sacredness, a deeper sense of responsibility than at present prevails. Our servants, too, claimed to recognise the blessings of domesticity by long services faithfully rendered.

Our postal service, without being so comprehensive in its various ramifications as at present, was infinitely more costly to the general public. The principal office in London was located in Lombard Street, the same premises indeed as those now occupied by the branch. We had a 'twopenny' post which included London and its suburbs, and a 'general' post which covered the whole of Great Britain, Ireland, and the Continent. There was no uniform fee for letters carried beyond the London district, but each missive was charged upon its own merits, having regard to weight and distance. On two nights in each week—Tuesday and Friday—the foreign mails were made up and despatched. The mail coaches gathered their precious freights from the southern side of the building, opposite St Swithin's Lane; and thence, heralded by a flourish on the horn of the guard, they proceeded on their several ways. The scene, as may be supposed, was a busy one. Four horses were attached to each vehicle; the driver and guard—personable men

—were superbly attired in scarlet coats richly embroidered with gold lace. The bags were placed under the care of the guard, who in case of an attack on the road was furnished with a loaded blunderbuss and a pair of pistols. This precaution was by no means unnecessary in those days; the roads were dark and for the most part unprotected, and the race of highwaymen was by no means extinct. As a rule we had but one delivery of country letters during the day, and that was usually the first; those posted in town—that is, the ‘twopenny’—were left more frequently. The ‘general’ postman wore a red coat without lace, and the ‘twopenny’ ditto sported a blue one; each garment being liberally garnished with metal buttons of a gold colour. Another peculiarity deserves mention: in order to facilitate the night collection, a red-coated man paraded the principal streets with a large leathern bag and a bell; the ringing of which was a summons to merchants and others to deliver to the bearer all those letters that were at the moment ready to be posted.

Certain of our recreations I have already glanced at in touching upon the occasional travels we undertook in search of ‘fresh fields and pastures new;’ but now and again an admonitory notion that some little change might be beneficial, would suddenly resolve itself into a temporary exodus for some place of entertainment, where amusement and recreation might be combined. White Conduit House, situated in the northern suburb of Pentonville, was a very popular place of resort, much affected by the middle class of citizens in those days. In addition to the trim gardens—‘where hot rolls and butter were supplied with your tea’—there was good music and a large concert-room, where some of the best Metropolitan singers might occasionally be listened to. Highbury Barn, also in the same neighbourhood, had its congenial attractions, beside a fine bowling-green. Indeed, without straying so far abroad, it was just possible that a visit to the Rosemary Branch Gardens in Hoxton—at that time surrounded by fields—would be amply satisfying. To those desirous of seeing the wonderful *Madame Saqui* in her midnight rope ascent, amidst a blaze of fireworks, or hearing popular singing, there was Vauxhall and its twenty thousand lamps!

Theatrical entertainments were not as a rule much patronised by the city-folk, owing possibly to a deficiency of dramatic instinct. There was, however, no want of attraction in this direction: Kean was at Drury Lane, Macready and Charles Kemble at Covent Garden, and Liston at the new theatre in the Haymarket; but notwithstanding, I do not remember that our visits were by any means frequent, excepting perhaps during the run of the pantomimes, and then mainly on account of the children. Home-loving and law-abiding, the long dreary nights were spent either in the parlour at home, or maybe at the fireside of the cosy tavern hard by, where the affairs of the parish were canvassed, politics discussed, and general good fellowship cultivated. A brown jug of foaming stout, with its companion pipe of aldermanic dimensions, a glass or so of brandy or rum-and-water, were the usual liquors. Wines of any kind were rarely indulged in; they were reserved for home consumption, over the family game of whist or cribbage; but punch was not ignored,

especially after the welcome display of a succulent leg of mutton and trimmings, or the materials connected with a tripe supper! The merry meal despatched, there was a song or two, until the drowsy cry of the watchman in the distance would rouse the dull echo of the street with a ‘Half-past eleven o’clock and a windy night,’ when the ‘jolly companions every one’ would shake each other by the hand and depart, each to his homely nest.

## THE COUNTER-SYNDICATE.

### CHAPTER II.—BULLS IN COUNCIL.

A MONTH after the opening of the coffee campaign, Mr Quick invited a few friends to spend the evening at his lodgings in Russell Square. They were of mixed nationalities—Americans, Germans, French, and Dutch. Most had reached middle age; some were under thirty, notably Mr Box, Junior, who looked like a boy beside bald heads and grey whiskers. All the party were connected with the money world and commerce. Mr Quick was the only lodger, for he disliked neighbours, who might have interfered with the privacy his affairs demanded. Pleasure and business combined to make the reunion agreeable in the extreme.

‘How stands the record now?’ asked an elderly gentleman, with a faint American accent, as he put the end of his cigar aside.

Mr Quick had been running up some long lines of figures; he raised his head, saying: ‘Upwards of a million bags have been sold in excess of those in existence. We hold about half the stocks of Europe; and if we could induce Grosschnabel and his connections to join us, we should be absolute masters of the situation. I dare not approach him, for he and Naylum run together. But unless we can secure his co-operation, we must be content with little fishes instead of great whales.’

‘I will see Grosschnabel,’ said another elderly gentleman, with a benevolent expression of face. He was the well-known Mr Lupus of Boston and Philadelphia, then travelling in Europe, and amusing himself with a little business as a pastime. ‘I know Grosschnabel intimately; and he is not the man to run with any one into a pit. He would sell Moses for Mohammed any day, if he saw financial justification at the end of the transaction.—You will pardon me for saying so, Mr Steinherz,’ he added, turning to a high-nosed, bilious-looking German beside him.

‘No offence to me, Mr Lupus. Wenn a man goes on de Bourse, he must forget many dings, and remember oder days denn diss.’

‘How have you fixed Boston?’ asked Mr Quick.

‘Every ounce of its coffee is in our hands; and by Friday we shall hold five-sixths of all in the States. A cousin of mine,’ continued Mr Lupus with his benevolent smile, ‘has got into a beautiful mess. He will come out of this coffee pool as truly ruined as Jeff Davis. He has given me invaluable information by cable, believing me in the swim with him.’

‘And Paris, Monsieur Griffe?’ demanded Mr Quick, from a little restless, dark-skinned man sitting opposite.

'*Paris est bien aimable pour nous,*' replied the Frenchman, smiling. 'I have made such a combination as never was dreamed of, even by Mirès in his greatest moments. You will be pleased to learn, gentlemen, that every cup of *café* drunk for some time in my beloved France, will be taxed on your behalf. We shall not only *écarter* the bears beyond anything known, but we shall push the market up to the highest point on record. A friend of mine, in the Ministry of Commerce, for certain considerations goes with us. When we are ready, he will let this pretty *canard* fly through the French press; for we can use that admirable instrument on our side of the Channel also.' With this cheering intelligence he winked at Mr Quick wickedly, and drew from his pocket-book a slip of paper, and read aloud as follows: "'It is said to be the intention of the Minister of Finance to add twenty centimes per kilogramme to the impost upon coffee, to enable him to lessen the burdens upon bread-stuffs. The latter are the most important items in the consumption of the masses, and the Emperor has their well-being ever at heart. Coffee is in a great measure a luxury of the rich, and it is only right that they, and not the working classes, should bear the heavy charges required for maintaining our great nation at the head of civilisation.'"—What do you think of that? As soon as the *canard* appears, all the coffee in France will make a huge jump in price, and we shall make a double coup.'

'Bravo, bravissimo!' cried several of the party, clapping their hands.

'In Germany, all goes well,' said Mr Steinherz, after the effect of M. Griffe's communication had subsided. 'From de Vesper to de Danube, we march like de gross Fritz. Mein Gott! vat a combination we have made! Venn I dink of de baddles of Finance, I dink dey are more wonderful, tausand times, den de baddles of Fritz, Napoleon, or Caesar! Vat plunder, vat prizes! Gentlemen, if we can make doo or dree more of dem combinations, we shall be de masters of de world.'

Mr Steinherz was not an enthusiast; but a *furor* had infected the room by M. Griffe's excited manner of narrating. Mr Steinherz had risen rapidly from the deepest poverty a German Jew living on the Russian frontier can know, to the power and affluence of a cosmopolitan financier. After wandering through half the countries of Europe, he had settled as a Parisian waiter in a *café* in the Place de la Bourse. There he had picked up many things besides ten centime pieces, and made his first stroke upon the French funds. He soon discarded the white apron, and took his place among the leaders of the *petite Bourse*; and by-and-by helped to float an Algerian Colonisation scheme. By this he gained a vast sum. His present mode of doing business was by moving a large mass of capital upon any of the great *certainties* of the commercial wheel of fortune. He had large influence with a group of bankers, and could control an immense region in an occult but most effective manner. His chief residence was at Frankfurt, where he had established a popular bank, having branches in every part of Germany. His clients were small-tradersmen and farmers. M. Griffe, an old acquaintance, had introduced him

to Mr Quick; and he proved an admirably useful member of the syndicate.

'Don't you think we should get possession of Italy?' inquired young Box, at the first opportunity of obtaining a hearing, and eager to make a telling suggestion upon the veterans before him. 'I think with Italy our winnings would be much larger still. I know an Italian.'

'Italy!' ejaculated M. Griffe with a condemnatory shrug. 'Italy is a laffl where peasants make their own coffee of roasted roots, and nobles make it of burnt corn. Italy! No!' He said this with a snap, that made young Box blush.

'Italy,' exclaimed Mr Steinherz with sudden gravity.—'Italy is not an honest contree. Vat lies dese Italians tell! I vas invited to open a branch of my bank in Milan, to lend money to shopkeepers and farmers. Vell, de first client vatever came vas a nice old priest, vo wanted to borrow tausand lire upon a picture by Leonardo da Vinci. He said his leedle nephew vas going to the University of Pisa, and wanted money for his studies. De picture vas de last one of de gallery of his family of nobles, gone poorer and poorer. Vell, de picture vas a *chef-d'œuvre* of course. It vas in de priest's cell in his monastery, just out of de town. I went to see it myself. It vas splendid! Moses taking a last look from Pisgah! I wanted to buy it; bud de old priest would not sell. No; only leave it as a pledge for de tausand lire. Vell, I could see it vas worth fifty tausand francs, so I agreed to lend de tausand lire at twenty per cent. for a year. De old priest accepted my terms very villing; bud he did not vant his friends and de monks to know of de transaction. So it vas arranged dat I should send my servants vid de money after dark, and den nobody would see de picture taken away. De money vas to be in coin. Vell, all went right. De old priest vas at de door of de monastery, a poor half-ruined building. My men gave him de bag vid de tausand lire, and he took dem into his cell to sign de receipts. De picture vas not large, about four feet square. While my men vere putting de cloth over it, de candle fell out de priest's hands on to de floor. He went away to get a light; bud he did not come back. My men waited and waited long time; bud he did not come back. At last, Joseph, my oldest man, went into de corridor, and left Isaac behind him while he looked for de priest. Now, dese men vere two honest Jews, relations of mine from Poland. Vell, at last Joseph found de door going into de street; bud just as he got to it, two *shirri*—dat is policemen—jumps on him! He calls out; and Isaac, hearing de noise, runs out to him. De policemen jumps on him too; and he had de picture in his hands. Denn dere is an awful row. De monks and de prior and de people come out; lights are brought; and my servants are charged mit stealing, stealing, stealing!'

'But where was the old priest?' cried Mr Quick, much interested in this story.

'He vas gone!' answered Mr Steinherz indignantly.

'Gone! where?' demanded all the party.

'I do not know. Bud I would give twenty tausand francs to catch him now. It turned out dat he vas not a priest at all, bud a beggar,

vo had lived about de monast'ry and helped de sacristan, doing leadle commissions for him. De picture belonged to de monast'ry, and vas being cleaned in an empty cell; and de old man had taken me to see it vinn de monks vere at dinner. Mein Gott! vat a selvindler dat beggar vas!

'And you lost your money, I suppose?' said Mr Lupus very calmly.

'Being in Italy, I should dink so,' retorted Mr Steinhertz scornfully, raising his eyebrows.

'Bud dat vas not de vorst. My servants vere taken to prison. I waited for dem till midnight: for I wanted to put de picture in de safe, after it vas taken out of de frame. Venn de glock struck twelve, I heard a knock at de door. I open it. But instead of Joseph and Isaac, six policemen run in, and before I can speak, I am fastened in a chair by some of dem; my keys taken from me, my papers seized; my office searched. Den I go to prison also!'

Looks of astonishment and sympathy passed round the circle of listeners.

'And dere I remained,' continued Mr Steinhertz with a sigh, 'for six days; ontill de Consul got me out, by proving dat I vas an honest banker and not a thief at all.'

There was something grotesque in the mixture of resignation and indignation with which the banker closed this phrase. Young Box had much ado to prevent a burst of laughter, and stooped to pick up an imaginary pin, to hide his face.

'Ah! but wait; dat is not all,' said Mr Steinhertz, seeming to find a solace in relating his woes. (The party had turned towards the table, supposing he had finished.) 'Venn I got back to my office, vat a desolation! All de money gone! De police, or somebody else, had robbed me of more dan ten tausand francs; and I could never, never get any satisfaction. Altogeder dat affair cost me more dan twenty tausand francs; for I had to shut up de branch bank vitout doing any business vatever! All sorts of people used to come in, pretending to vant money, but only to see de Tedesco banker, as dey called me, vo had tried to steal a picture from a monast'ry! Everybody believed dat I had bribed de police to get me out of prison. So I had to leave Milan, defrauded, deluded, and disgraced; vich, I tell you, gentlemen, is very hart for a man like me to bear.'

'A bas l'Italie!' cried Monsieur Griffe energetically.

'I have no doubt the beggar, the monks, and the police were in collusion to fleece you,' said a Mr Bellamy decisively. 'Accept my congratulations that you came so well out of the affair. If you had been in the Pupal States, you might have been stripped of your ultimate centime. I have had transactions with Italians, and have lived in the country. No one but a business man knows what the Italians are capable of. Our little syndicate is smart in its way; but I assure you the Italians can do yet smarter things. I will put one of those fellows against four of the 'cutest men of the state of Maine, and he will clean them neater than ants can a bone. My opinion is that we keep clear of that boot-shaped country; for whatever stranger puts his foot into it has to pay dearly for getting it out again.—But, gentlemen, we are going wide of the business.'

'So I was going to observe, some time ago,' said Mr Lupus, who disliked any deviation from the straight path of commerce. 'Mr Steinhertz no doubt feels strong on the subject of Italy; but the purpose of our meeting is to enhance the price of coffee. I have a little suggestion to offer. The bears have used the newspapers with consummate skill, for which I tender them my high esteem and continuous thanks. Our friend Monsieur Griffe will use those potent instruments in France on our side. But I think we must employ them here too, as soon as the reaction has fairly started. Remember, gentlemen, the secret of modern commerce is to bring transactions to a speedy close. Those who dally teach the world to be as wise as themselves. In the next four weeks our pile must be made and stored, or we shall have to share the winnings with outsiders. Besides, I shall be in another boat very soon, and it is my habit to do only one thing at a time.—My friend Stubbins,' he added, putting on his spectacles, and drawing a printer's proof from his bundle of papers—'my friend, as you know, Mr Quick, edits the *International Produce Market Guardian*, in which I have an interest. Now, he has written for me this article, which will appear at the right moment:

*"Collapse of the Coffee Scare.*—At last the trade and the public show signs of returning good sense, and coffee is therefore returning to its normal quotations. It is almost incredible that, in this nineteenth century, such a number of gullible people could be found, as have furnished the victims to one of the most glaring commercial *ruses* ever perpetrated. Coffee, which is one of the steadiest articles of consumption, has lately been 'rigged,' to use one of those odious Americanisms now tainting our commercial vocabulary, by a great financial house in our midst. This establishment, hitherto pursuing the noble course of old-fashioned British trade, has suddenly entered upon the system invented by a school of financial desperadoes in the United States. Fictitious sales of Costa-Rica coffee to an enormous amount have been made, not in England alone, but on the continent and in the chief cities of America. The result of this Herculean operation, as we know to our cost, is the startling fall in the price of all descriptions of coffee, though, of course, Costa-Rica has suffered most.

'Merchants, brokers, retailers, have quite lost their heads during this purely fictitious panic; so that the gamblers have had everything their own way, and the vast public of two continents have been utterly at their mercy. The 'bearing' of the markets has been carried to a most audacious length; and now that the tension is being removed, we shall witness a gigantic rise in prices. Either by the artfulness of the operators for a fall, or by the unconscious assistance of inflamed imaginations, the most Gulliverian fables have been running through the provincial press during the crisis. One of these precious concoctions states that a German travelling botanist has discovered a wonderful coffee forest in Central America. The trees are said to be upwards of fifty feet high! Such a forest is so obviously of Münchhausen origin, that it should have excited the incredulity of even babes

and sucklings. But strange, passing strange, the graybeards of the Royal Exchange and Mincing Lane have swallowed it as gospel-truth, and coffee has changed hands at figures that should only be known in the buying and selling of Hanwell or Colney Hatch.

"But a still more impudent paragraph, evidently coined by the 'riggers,' has appeared in all the newspapers; not those confined to rural localities, for even Metropolitan editors have given it the hospitality of their columns. It declares that a French chemist has found a method of creating coffee in his laboratory, which will reduce the price of the article to zero! This requires unusual powers of swallowing to get down. But what shall we say of the other part of the alleged invention, namely, that SAWDUST is to be the medium for absorbing the chemist's coffee essence!! Can the force of folly further go?

"The outrageous consumption of coffee during the innings of the bears, has made desperate havoc among the stocks of coffee all over the world. Extravagance is generally followed by penury, and the betrayed public will perhaps have to pay five shillings a pound for its coffee in the near future. This is the serious side of the affair. The bears have succeeded in creating a coffee famine, and it is to be hoped that they will be dragged before the deceived and plundered community, and denounced as they deserve. In the meantime, our advice to the trade is—buy coffee while you can."

"Masterly!" "Superb!" "Glorious!" were echoed round the table, when Mr Lupus finished reading. He had not changed a muscle of his face, nor varied the inflections of his voice during the whole time. This had aggravated the risibility of young Box so much, that he wriggled in a hundred contortions, and finally roared as he reeled, holding sides, round the room.

The party retired to sleep the sleep of the just. The next day they rose endowed with a supply of energy that bewildered Mincing Lane and the tea and coffee marts of Europe, Asia, and America.

#### PLATE-GLASS.

ONE of the most conspicuous features of our modern streets is the extensive employment of large squares of plate-glass for the windows, in place of the old-fashioned and much smaller panes of common or sheet glass. And this does not apply only to large cities and rapidly increasing suburbs; the change may be observed in quiet market towns, and even in villages. The rustic shopkeeper in these days catches something of the ambitious and enterprising spirit of the times, and is not satisfied until his old-fashioned, small-paned windows—to peep into which the small boys had to stand on tiptoe—have been replaced by a stylish shop-front, with sheets of plate-glass reaching nearly to the ground.

We cannot deny that the broad reflecting surfaces of large plate-glass windows give a handsome and attractive appearance to our city streets; but we have sometimes been disposed to regret the zeal of the village trader, whose quaint and unassuming little windows were so much more in

keeping with rustic surroundings, than the pretentious modern shop-front which has too often taken their place.

A recent visit to one of the largest plate-glass works in the north of England gave us an opportunity of carefully observing the different stages of the manufacture; and we shall endeavour to help the reader to picture the process for himself.

The town in which the works are situated was by no means picturesque or attractive-looking. It seemed to be chiefly made up of huge factories with tall chimneys, that smoked vigorously; large bare spaces around them, more or less under water; and rows of workpeople's cottages. The atmosphere of the place, too, was peculiar; it reminded one of the air of a room which had been recently fumigated by burning sulphur in it; but there were occasional reminiscences of various other of the disagreeable smells of a chemical laboratory. Our walk to the works lay through narrow and extremely dirty streets; so that, what with the irritation of our eyes, throats, and chests by the sulphurous air, and that of our temper by the muddy footways, we arrived at our destination in a severely critical frame of mind. All feelings of annoyance, however, soon gave place to those of interest and admiration, as we were conducted by a courteous foreman through the various sheds in which this instructive manufacture is carried on.

Plate-glass is made from a mixture of limestone, sand, soda or potash, baryta, arsenic, and other minerals, which are finely ground, and carefully mixed together. The prepared mixture is called 'batch' by the workmen. It is a dark, greenish-black, earthy powder, which looks as little likely to change into a beautiful transparent substance, as Cinderella's pumpkin into a glass coach. But fire is a wonderful transformer, and it is by melting this greenish-black powder in crucibles that glass is produced. When we mention crucibles, our reader will at once picture to himself those little vessels, not much larger than breakfast cups, into which, in days of yore, the alchemist's devoted wife would drop her wedding-ring, in order to aid her anxious husband in his search for the philosopher's stone. But the crucibles made at the plate-glass works are, like everything else there, on a large scale. They stand about three and a half feet high, and are some three feet across the top, becoming somewhat narrower below, and looking like gigantic flower-pots with immensely thick walls. We saw them being fashioned by hand out of fire-clay of the finest quality, and very carefully kneaded. Several small boys were working this clay into rolls of the size of an ordinary rollypoly pudding. With these the men were building up the sides of crucibles, layer upon layer, taking great care to exclude any bubbles of air, which, if left in the clay, would cause the pots to break when heated. When finished, the pots are kept several months in a

drying-room; they are then baked in a furnace, which is heated to as high temperature as they will have to bear when in use.

After inspecting the manufacture of the crucibles, we were conducted to an extremely torrid region, where a number of furnaces were blazing away. Each furnace is really a gas-fire, in the midst of which are placed one or more of the crucibles, filled with the greenish-black powder. The gas—ordinary coal-gas, manufactured on the premises—is mingled in due proportions with atmospheric air; and when ignited in the furnace, it heats the latter hotter than any coal-fire would do. This substitution of gas for coal as a fuel is in accordance with the method of Dr Siemens, and has been found—so our guide told us—to have many advantages. Peeping through the chinks of a furnace-door, we saw a fiery, glowing mass. This was a crucible at a bright-red heat. The greenish-black 'batch,' with which it had been filled some hours previously, was now a red-hot molten mass, of about the consistence of treacle.

As it had now attained its proper condition of fluidity, the men came and fastened some iron gear around the neck of the crucible, hoisted it out of the furnace, and placed it on a truck. This was immediately run along a tramway—we hurrying after it—to another shed, where the casting of the glass was to take place. This was the most exciting incident of the manufacture. Eight or ten men again threw some tackle around the glowing crucible, hoisted it into the air above a large, flat, cast-iron table, and then tilted it over. The luminous contents of the crucible flowed out in a sluggish stream, and formed an irregular doughy mass at one end of the table. The crucible was instantly hoisted away; and a heavy iron roller was rapidly rolled over the soft yielding mass, causing it to spread out into a wavy sheet, covering the entire table. Our guide explained that the height of the roller above the table could be regulated, so that the glass should be of the required thickness; and that the width of the plate was determined by iron bars placed along each side of the table. The sheet which we saw cast was about twelve feet long, nine feet wide, and an inch thick.

The next step in the process is the cooling of the glass. It must not be treated as we should treat a plate of toffee in similar circumstances, by letting it simply stand in a cold place. If the glass were allowed to lose its heat rapidly, it would become too brittle to be of any use. Accordingly, within five minutes of its being rolled out—as soon, indeed, as it was solidified enough to bear removal—the still glowing sheet was lifted from the table, and with long shovels, was pushed through a slit in the wall, which was then carefully stopped up, and we saw it no more. Our guide explained to us that the sheet had been slipped into an oven, which was at a good red-heat, and that the fire would be allowed to die out very gradually. In this way, the glass would take fully a week to cool down; and by this process of annealing, as it is called, it would attain the requisite amount of durability.

From an oven which had cooled down, we saw the men remove a sheet of glass, and bear it off

to be ground and polished. Six men carried it, three on each side, the glass being held up perpendicularly between the two files of men by means of three leather bands or slings passing underneath it. Each man held one end of a sling in one hand, and steadied the sheet with the other. It was interesting to observe what admirable time the men always kept while thus carrying the large plates of glass from one department to another. They had evidently been well drilled; and the necessity for this was obvious, since a man who did not keep step would be liable to thrust his shoulder against the glass, with results which might be serious to the plate, himself, and his comrades. With measured steps and slow, then, the men preceded us to the examining-room. Here we could observe that the annealed plate was semi-opaque and its surfaces rough and undulating. Plate-glass in this crude condition is largely used for glazing roofs, and in other cases where light without transparency is required. In the examining-room, the plate was carefully inspected, to see whether it presented any defects. Had there been any serious ones, it would have been cut up into the largest pieces which could be obtained free from flaws. Our plate, however, was perfect; and after its rough edges had been taken off, it was at once conveyed to an adjoining building to be ground.

The grinding-room, which was a large shed fully a hundred yards long, had a most bewildering aspect when we first entered it. It looked as if the floor were made up of numberless separate pieces, each piece executing a dance round and round on its own account, without regard to the time its neighbours might be keeping. A little attention, however, soon enabled us to unravel this mysterious maze of moving matter. Ranged up and down the room were twenty-eight pairs of low stone tables. Resting upon each table, and cemented to it by means of plaster-of-Paris, was a sheet of glass to be ground. Lying flat on the sheet was a wooden frame, looking like three ordinary doors fastened loosely together side by side. This tripartite frame was kept moving round and round over the glass by means of a horizontal revolving crank, with which one end of it was connected by an iron rod. The movements of the frame were steady and limited by an ingenious arrangement of chains passing from its upper surface to the roof. It was the constant rotatory movement of these fifty-six frames which at first sight gave the room such a strangely unstable appearance. The frames were lined with iron underneath; and men and boys were constantly employed in throwing sand under them, while a jet of water played over each frame; so that wet sand was thus kept continually present between the iron and the glass. By this means, the surface of the glass was rubbed away until all unevennesses had been removed. It takes about seven hours to grind both surfaces of the plates sufficiently. When this has been done, the glass is found to have lost nearly half its thickness. Its surfaces are now even and comparatively smooth, but covered with fine scratches, and by no means clear and transparent.

We were next conducted into a shed in which the second part of the polishing process is carried on. This is called the smoothing-room, and the machinery here appeared to be entirely super-

intended by women and girls. In this room, as in the grinding-shed, were a large number of low stone tables or slabs, on each of which a sheet of glass lay cemented. Another sheet of glass was placed upon this, and the upper plate was kept moving over the under one in a circle by means of machinery similar to that which worked the grinding-frames. Instead of sand, the plates in the smoothing-room were supplied with fine emery powder, and by their prolonged movement over each other they both became much improved in appearance.

Although, when it leaves this second room, the glass has attained a high degree of smoothness, it is still wanting in that perfect polish and transparency which are so much desired. It is therefore submitted to a third process, the polishing proper. This is accomplished by means of very beautiful machinery. The plate of glass is laid upon a table, and above it a horizontal frame moves slowly backwards and forwards, on the under surface of which are a large number of rubbers, arranged in four rows. While the rubbers move to and fro, the table itself moves slowly from side to side, and thus every part of the surface of the glass is brought evenly and regularly under the action of the rubbers. The rubbers are covered with felt, which is kept moist and supplied with polishing-powder, consisting of red oxide of iron. This beautiful process raises the surface of the glass to the highest degree of smoothness and polish.

From the polishing-room the plates are carried, in the careful manner already described, to a shed where women are engaged in washing off the red oxide and in giving them a final rubbing-up. They are then conveyed to the warehouse, where they are packed, and whence they are despatched as required to all parts of the world.

Here our interesting inspection came to an end. We had followed the greenish-black, earthy powder in its various transformations, until we saw its final product in these beautiful sheets of plate-glass, ready for use in mirror or shop-front, hotel or mansion, steamer or railway carriage.

## THE STORY OF A THUMB-MARK.

### VI.

NEXT morning, a little after ten o'clock, Mr Slater and Mr Carson entered with a few assistants, the counting-house of the manufacturing works of Greig & Co. After a little conversation with Mr Sinnott the head-clerk, and measures having been taken to ascertain that all the workmen were on the premises, orders were issued by Mr Carson to his assistants to watch the several doors leading from the works, while Mr Sinnott sent a message to the men that they were requested to meet him in the warehouse immediately. At once the machinery of the place was brought to a stand, and one by one, as they were free to go, the workmen filed into the warehouse, each with an anxious and curious look on his face, as if all felt instinctively that the meeting had something to do with the mysterious death of their late master.

When all were assembled, Mr Sinnott ordered the doors of the room to be locked, and briefly stated to them that what he did was under warrant of the authorities, Mr Carson having been sent, along

with Mr Slater, to carry out certain investigations of a legal kind. He hoped the men would frankly lend their assistance so far as it was asked, as it was of importance to each and all of them that the murderer of their late master should be discovered, so as to free innocent men from an injurious and painful suspicion.

One or two of the men at once signified their willingness to serve the ends of justice so far as they could do so; but the bulk of them stood silent and awed, as if they would rather have been free from the scrutiny to which they believed themselves about to be subjected.

Mr Slater and Mr Carson proceeded without loss of time to carry out the object of their visit. A smooth tablet had been prepared, with a thin coating of colouring matter on the surface, and it was explained to the men that it was desired to obtain from each of them an impression of the thumb of the left hand. This was done, as Mr Slater showed, by first colouring the ball of the thumb by pressing it on the tablet, and then transferring the mark to a sheet of paper, by next pressing the thumb thereon. The process was of the simplest kind, and the work was soon begun. Each man, after giving the required mark on a separate sheet of paper, duly numbered, was desired to write on the same his name and address, whereupon the paper was handed to a photographer, who was present with his apparatus, and a photograph taken on glass of each individual mark.

The work, though carried out as expeditiously as possible, still took a considerable time, there being in all twenty-four such impressions taken. When the work was at length so far completed, the photographer stretched a white screen in the room; the shutters were closed to exclude the light, and the apparatus which had been used in photographing was now exchanged for a magic-lantern.

While these preliminaries were being adjusted, a painful silence was observed by all; and as the stream of white light from the lantern fell upon the faces of the men as they stood huddled together on the floor, giving to each countenance a wan and pallid look, it was evident that each felt himself to be all but face to face with some strange and as yet incomprehensible mystery.

Meantime the photographer was forwarding his work, and all eyes were now directed to the screen. 'There is thumb-mark No. 1, the original one, Mr Slater,' said the operator, as a maze of lines in coarse network grew upon the screen, after a few fitful jerks and alternate apparitions and effacements.

'That,' said Mr Slater, addressing the men, 'is the key to what we are in search of to-day. We will be fair and above-board with you, now that we have got the work thus far done. The lines which you see cast upon the screen are the magnified impression of a mark in blood on a sheet of paper which was found on the desk at which your master, two mornings ago, was found sitting dead. It is the thumb-mark of a man—of the man, I believe, who committed the murder; and as it has been shown by scientific men that every individual may be known by the peculiar and special arrangement of the furrows on the skin of the fingers, we have come to ascertain if any one of the thumb-marks which you have given us

to-day agrees with the lines and markings of that now shown on the screen before you.'

None of the men spoke in reply to Mr Slater, only a curious sound, as of a stifled groan or a muttered threat, issued from a dark corner of the room; but the individual from whom the sound proceeded could not be ascertained, though more than one head was scrutinisingly turned in the direction whence it came.

Mr Slater, turning to the photographer, said: 'You can now go on. Produce No. 2.'

The operator placed another slip of glass in the camera, and over the first maze appeared a second on the screen. The two were obviously distinct. 'Can you make the figures coincide?' asked Mr Slater—'superpose one over the other, I mean.' This was done, and the mesh became involved and mixed. 'That will do; try No. 3,' continued Mr Slater. 'No. 3's name is Donovan. There is a smooth blotch in the middle of his thumb-mark. That's not it. Try the next—No. 4, Roper. Roper has apparently been cutting cake-tobacco and his epidermis at the same time. Just look at those gashes running up and down. Roper is acquitted.'

And so on they proceeded with the examination of these strange signatures made by the various employés of the firm. They had examined in vain more than half the specimens procured; yet Mr Slater was by this time firmly convinced of the validity of the proof, if indeed the proof hoped for should be forthcoming; so various, and so markedly and unmistakably characteristic, were the different sign-manuals thrown upon the screen.

'No. 17, Charles Packs,' called the photographer, putting in another slip.

'Hollo!' cried Mr Slater; 'are you sure you have got both in the lantern?'

'Quite sure; but they are superposed. Now I make them separate—it is the same thumb-impression.'

'Charles Packs, thou art the man!' said the lawyer solemnly.

Every eye in the room turned in search of Packs, and in another second he was dragged from the dark corner whence the muffled sound had shortly before been heard to proceed, and placed before Mr Slater. He was a sullen-looking man, rather undersized, but powerfully built. He stood stolid and dumb, without lifting his eyes.

Mr Slater, addressing him, said: 'Charles Packs, you stand here before your fellow-workmen, under the terrible suspicion of being a murderer. You have seen the experiments we have made, and you have witnessed the result; what have you to say?'

The man was silent. At one time his lips moved as if about to speak; but he seemed unable to utter a word. Mr Carson approached him, and in another moment he was handcuffed, and led away. Not a man in the room but felt that only a sense of guilt on the part of Packs could account for his shame and silence when the charge of murder was thus made against him.

An hour afterwards, a message was brought to Mr Slater, that Packs wished to speak with him. He went at once to the prison, and found the man in his cell, utterly stricken in spirit. 'My sin,' he said to the lawyer, 'has found me out.'

And thereupon he proceeded to make a clear confession of his guilt. He had entered his old master's room for the purpose of robbing him, and he ended by taking his life. He had counted upon the possibility of such a crime being the result of his attempt; and had picked up young Anthony's knife as he passed his desk on his way to commit the deed. But in the course of the struggle that ensued, the knife dropped out of his hand, after a slight wound had been inflicted on the old man, and the unfortunate victim had been cruelly garrotted. Being aware of the quarrel between old Anthony and his nephew, Packs had left the knife where it had been found, in order to cast suspicion upon the young man. Yet after all, as the wretched man admitted, he did not succeed in committing the robbery he had planned; for the sound of a footstep outside had scared him, and he rushed off without waiting to effect his purpose. The unexpected result of that day's investigation had staggered and unmanned him; and he did not now care how soon an end was put to his career of falsehood and crime.

Subsequent inquiries elicited the fact that Packs was only an assumed name; and that the same man, under the name of Sullivan, had been long known to the police, and been more than once convicted of robberies and assaults. He had worked in the establishment of Greig & Co. for about a year, during which time he had always been an object of suspicion, more or less, to his fellow-workers. At the subsequent assizes he was found guilty of the murder of Anthony Greig, and paid the last penalty of the law.

Meantime, the incrimination and confession of the murderer brought relief to young Anthony Greig and to his cousin Grace. Robert Slater, by his management of the case, worked himself into distinction, and his business increased accordingly. And by way of strengthening the ties which thus united his fortunes to some extent with that of Greig & Co., he before long married Miss Grace, who inwardly admires, though outwardly she occasionally complains of, her husband's rather too acute faculties of observation.

## STUDIES IN ANIMAL LIFE.

### FANTASTIC FRIENDSHIPS.—PART II.

THE first if not the chief fact to be noticed in studying animal life is that animals vary as much in temperament and disposition as human beings do. The differences of disposition, and variations of mood to which all living creatures are subject, will account for many of the apparently whimsical attachments formed between animals of opposite species, as well as of proclivities presumed antagonistic, and which cannot be explained on the grounds of education, habit, or want of companionship. The member of the one species doubtless discovers that sympathy in the action of another family which he cannot find in his own. Few students appear to perceive that many animals possess natures and amiable tendencies quite different from those popularly supposed to characterise their own particular species, and that these feelings may prompt them to contract friendships with animals

of other species similarly disposed. If man would only recognise the probability of the nobler qualities being existent in brute creatures, and endeavour to call them forth, the records of gallant deeds performed by animals would be rapidly enlarged.

Save by a few special observers, the cat's nature is supposed to be a compound of cruelty and cunning, and yet our records prove the fallacy of generalising from this popular theory. Anecdotes of the fidelity and amiableness of the cat are only outnumbered by those appertaining to the dog; their friendships are strong and enduring. The Rev. F. O. Morris, in his *Natural History Anecdotes*, cites a remarkable instance, communicated to him by Mr E. Pollock of Sligo, of a terrier's rescue by a cat. A bulldog had seized a little terrier by the throat, and although beaten and hustled by a crowd of people, would not let go his hold. Suddenly, a cat that lived in the same house as the terrier, and was always fed with it, sprang through the mob, and fastening on to the dog's head and throat, lacerated him so severely, that he was forced to let the terrier go just as it was on the point of being choked. By kind treatment, it was ultimately revived. Strange to say, the opportune deliverer had kittens at the time, yet, for her poor little friend's sake, she risked everything. As indeed has been pointed out by naturalists, affection will outweigh the strongest impulses of nature in animals, inducing them even to forego all food, and perish of hunger or grief, for the loss or absence of a friend, while for the help or protection of an ally they will risk their own safety.

Cats and dogs, when on friendly terms, will occasionally combine against a common foe. The Rev. L. Jenyns was informed by a lady correspondent that a little Blenheim spaniel of hers once accompanied her to the house of a relation, and when being taken into the kitchen to be fed, two large cats flew at it and scratched it severely. During the lady's stay at this house, the spaniel gradually contrived to form a friendship with the gardener's cat, and one day persuaded it to follow him into the kitchen, where, finding one of his enemies alone, he set at it, and, assisted by his feline ally, gave it a sound drubbing. The two victors then remained in possession of the field until the other foe appeared, when they both fell upon it, and drove it too from the kitchen. During the remainder of the visit, the spaniel and the gardener's cat continued their friendship for each other, eating off the same plate in undisturbed amity.

Nearly every one can point to singular instances of close friendships formed between dogs and cats; and some very remarkable accounts of their attachments for other animals have been recorded in this *Journal*; but certainly no one can tell of a more eccentric choice of a companion than that related by Jesse the naturalist. The anecdote was told him by an engineer of repute, who, during a nine years' residence in the United States, had charge of the construction of some extensive works, one being the erection of a beacon in a river swamp. During the progress of the work, a young alligator

was caught, and became the property of the engineer. This strange pet he tamed thoroughly, so that it followed him about the house like a dog, even contriving to scramble up-stairs after him. It displayed great affection for its master; but its chief friend, when taken to New York, was a cat. The attachment was reciprocated, and nothing seemed to disturb the friendship of the curious couple. When the cat reposed before the fire, the alligator would place himself close to Puss, and go to sleep. When Puss chanced to be away, the alligator would become restless and unhappy; but as soon as she returned, regained his spirits.

White, in his ever interesting *Natural History of Selborne*, records a strange instance of a cat's affection for a leveret, and although it is not so unhackneyed, nor, as in the preceding cases, so singular an attachment, having been evidently induced in the first place by necessity, it is too appropriate a fact to be passed by untold. About the time that a friend of White's had a little leveret given to him which was so helpless it had to be fed with milk in a spoon, his cat was deprived of her helpless young. Suddenly the hare disappeared, and was supposed to have fallen a prey to some of its natural enemies. About a fortnight after its loss, as White's friend was sitting in his garden, he noticed his cat trotting towards him with tail erect and self-satisfied mien, uttering little notes of complacency, such as cats use towards their kittens; whilst gamboling after her came the leveret, which Puss had adopted, and henceforth continued to support in the most affectionate and motherly manner.

Mrs Lee, to whom we are indebted for many suggestive anecdotes of animal life, tells a still more wonderful tale of a friendship made by a cat with a canary! Both these creatures belonged to the narrator's mother-in-law, and, as presumed natural enemies, were carefully kept apart. The bird was only allowed out of its cage when grinnalkin was shut out; but one day, to the lady's consternation, she beheld the cat in the room, and the canary perched on its back. However, Puss seemed friendly, and the bird fearless; and so they were left undisturbed for the while, and on several other occasions disported together affectionately. One morning, when they were in their mistress's bedroom, the lady was horrified to hear the trusted cat give a low growl, and seizing the bird in her mouth, jump on to the bed, where it stood, with bristling hair, glaring eyes, and stiffened tail. At this moment, the lady beheld a strange cat creeping cautiously into the room. She drove it away; and as soon as it had disappeared, her own faithful Puss deposited her little feathered friend upon the bed quite uninjured, it having only been taken up to preserve it from the claws of the intruder.

Attachments between cats and birds are by no means so rare as might be supposed, although it is noticed that it is generally in the case of one especial favourite bird, or of those domesticated with it, that the feline companion foregoes her usual instincts. The Rev. F. O. Morris tells us of a remarkable friendship that existed on a farm near Leipsic between a cat and a chicken. The four-footed companion of the bird was almost constantly with her favourite, and guarded it from every danger. When the chicken grew up, the cat still remained on friendly terms with it; and

when the poultry were summoned for feeding, Puss always attended, and would not permit any of the fowls to approach till her favourite hen had first satisfied her appetite, after which they were allowed to feed unmolested. Bishop Stanley mentions a case of a poor little kitten whose mother had been killed, taking up its abode with some fowls and their young, and becoming so friendly with them, that sometimes it might be seen playfully catching at their feet, as if about to bite them, whilst they playfully pecked at their singular companion in return. Sometimes the kitten would hide behind a bush or shrub, and then unexpectedly springing into the midst of them, without their displaying any fear, would purr and rub against their sides. One particular hen, however, was the kitten's especial favourite, and every day she would accompany it to its nest, and lie down outside, to wait for its reappearance.

One of the most remarkable instances of a cat's friendship for the feathered race is related by the late Mr Kingston in his *Stories of Animal Sagacity*. In a loft where Puss was rearing her kittens, a pigeon had built her nest. The bird had frequently lost her eggs and young through the depredations of the rats; and this, it is surmised, had prompted her to build her nest close by the cat's snug quarters. Puss offered no objections; and in a little while the two matrons became quite sociable, feeding out of the same dish, and displaying much affection for each other. The strangest part of the matter was, that when Puss was absent, the pigeon constituted herself defender of the kittens, flying at any one who attempted to approach them, and striving with beak and wings to drive the intruder away. Subsequently, when neither her own brood nor the kittens required her further care, she was often seen fluttering close to her feline friend, when Puss was making her excursions abroad. Surely, no more marvellous instance of affection and gratitude overcoming the instincts of nature, is on record!

Enough has been said to prove that cats can sympathise with the most affectionate impulses of other animals; so, with one more curious case, we must turn to the strange attachments formed between other members of the brute creation. Mr Kingston is also our authority for the following anecdote. A frog that had found its way into a country house, had been kindly treated by the servants, doubtless with a view to its diminishing the beetles or other intruders, and had been permitted to take up its residence in the kitchen. As the winter evenings approached, the frog was wont to come forth from its place of refuge and bask on the hearth before the fire. A favourite old cat, that had a long-established right to a place on the hearth, took a liking for her strange companion, and became accustomed to its nestling under her cosy fur; when froggy left its hole, it would hop towards Puss, who constituted herself its defender, and attempted to guard it against all intruders. The ultimate fate of the curious couple is left untold.

The fidelity of the horse is a favourite theme of the naturalist. Frequently, a dog or a cat is the object of the attachment, probably from the fact that those are the animals they are chiefly brought into contact with; but their

devotedness to their masters or attendants, and their gentleness to children, have formed the groundwork of a hundred tales. Youatt mentions many instances of attachments between horses and animals of other species, such as that of Duncannon, a well-known racer, for a sheep, which it would lift into the manger to share its fodder, but would permit no one else to molest it in any way. Chillaby, another famous horse, which only one groom ever dared to approach, had also a favourite lamb that it loved and tended with paternal affection.

A wonderful anecdote of affection in horses is told by Monsieur de Boussanelle, and although it is not an instance of friendship between animals of opposite tribes, it is too appropriate to our theme to be overlooked. This gentleman, a cavalry officer, mentions that a horse belonging to his company being, from old age, unable to eat its hay or chew its oats, for two whole months was fed by two horses, one on each side of it, who ate from the same manger. These two noble creatures drew the hay out of the rack, chewed it, and put it intact before the old horse, and did the same with the oats, which he was then able to eat.

Youatt, it is presumed, is the authority for an account of the way in which a colt repaid the kindness and care of a farmer's boy who fed it. One day, the boy was pursued by an infuriated bull, and contrived to reach a ditch and get into it before his pursuer could overtake him. The bull endeavoured to gore him, and would, it is believed, have succeeded, had not the colt come to his assistance. This grateful little animal assaulted the bull, screaming so loudly all the while, that some labourers were attracted to the spot, and rescued the lad from his perilous position.

But these incidents of animal attachments are not the exclusive prerogatives of domestic animals; not only do cats and dogs, horses and cattle, and other creatures brought up by, or living in amity with man, practise all the virtues generated by friendliness; but even the wildest and most, presumed, untamable beasts often evince similar kindnesses to their less powerful fellow-brutes. Natural histories are full of stories of friendship shown by lions to dogs; whilst many anecdotes of affection manifested by tigers for canine companions are also on record. Among other similar stories, Kingston relates the case of a pariah or outcast dog that was thrown as food to a caged tiger in India. The dog stood on the defensive in a corner of the cage, and as often as the tiger attempted to molest him, seized it by the lip or neck. The tiger was hungry; but eventually, finding the dog so tough a customer to tackle, it relinquished its onslaughts, and came to an understanding with the foe. When a mess of rice and milk was put into the cage, the larger brute willingly shared it with its courageous opponent; and henceforth they became staunch friends; the dog would run in and out of the cage, evidently looking upon it as his home, and indeed, making it such, until the tiger's death left it once more houseless and friendless.

That birds reciprocate the kindly feelings of larger animals, some of the preceding instances prove; but a most interesting anecdote of sympathy shown by a raven for a disabled companion was related in the *British Workman* some time since. A traveller upon reaching an inn-yard at Humber-

ford, drove over the yard-dog's leg and seriously injured it. The injured leg was carefully bound up; but in order to keep the dog quiet, it was fastened up by a rope in the stable, under a manger. The raven of the establishment had taken note of the whole proceedings, and whilst its canine friend was thus retained a prisoner, actually carried him bones, and faithfully attended to his wants. One night, the raven got shut out of the stable, and in its anxiety to get to its inviolable friend, actually picked a good-sized hole in the stable door! These incidents do not need comment; they carry their lessons with them.

### HITCHES AT THE ALTAR.

WHAT can be more awkward and embarrassing than a hitch at the hymeneal altar? There are few occasions in life when we are more anxious that everything should pass off smoothly and auspiciously; yet, with that perversity which Fate so often exhibits in her dealings with us, the marriage ceremony is one than which few, if any, seem more peculiarly liable to hitches of the most unexpected and mortifying character. We have all observed this, and some know it from painful experience. The slightest misunderstanding or forgetfulness may involve serious inconvenience and annoyance. For most hitches of this kind the principal actors in the scene—the bridegroom, bride, 'best-man,' or bridesmaids, or it may be clergyman—are responsible in some way or other; but interruptions occasionally arise from circumstances over which none of the parties could have exercised any control. We have happily outlived those 'good old times' in which it was the proper thing for the rejected lover to break in upon the wedding-party with a band of armed men, slay the bridegroom, and carry off the unfortunate bride; but even in the present day the evil genius of matrimonial candidates sometimes contrives to bring about equally vexatious, if less tragic interruptions.

The question how near a couple can come to being married without actually becoming husband and wife, was answered in a very extraordinary case reported not long ago from Lyon, in France. All the preliminaries, including the marriage contract—the bride being an heiress—had been arranged with the utmost harmony, and the day had arrived for the civil marriage—which, under the law of the Republic, is the binding one—on the morning, and for the blessing of the priests at the cathedral altar in the afternoon. The parties were before the Mayor, and what a Chicago lawyer, addressing a divorce jury, called 'the fatal question' had been asked of each and duly answered; whereupon the Mayor had tendered his personal as well as official congratulations, and placed before them the attesting document which, when signed, made them lawfully man and wife. At this critical moment, the proceedings were interrupted by the entrance of a telegraphic messenger. The couple paused, pens in hand; the witnesses stared in surprise; and the Mayor dropped his spectacles in a nervous fit as he handed the message to the bride's father. The telegram ran as follows: 'Monsieur — [the bridegroom] has already been married in Germany, and his wife lives. Vouchers are on their way to you by

post.' The Mayor, as he is bound to do under the Civil Code when a warning comes, postponed the authentication for a week. The week passed, but no vouchers came. Everybody agreed the telegram was a malicious trick, perpetrated by some revengeful rival—everybody excepting the bride, who had been brooding over the telegram, and, to the surprise of every one, believed it. She sent back the diamond ring, the silver candlestick, the gold-mounted *wig-dieu*, the breviary of the lady who was almost her mother-in-law, and annulled the settlement. The *Juge de Paix* of Lyons and the Mayor had a consultation with the lawyers and the notary; and it was unanimously agreed that the couple, as the English peasantry put it, were still a couple, and not a pair. All inquiries instituted by the bridegroom with regard to the sender of the telegram proved fruitless; the only information ever obtained being that it was paid for by a 'veiled woman in black.'

A still more recent hitch at the altar occurred at a fashionable English watering-place. A large party had assembled in one of the churches there to witness the nuptials of the niece of a prominent citizen, when it was discovered at the last moment that the Registrar, who had the license in his pocket, had not arrived. At the suggestion of the officiating clergyman, the ceremony was delayed for a short time, while one of the party went in search of the errant Registrar. His office was the first place visited; but he had gone out, and nothing was known of his whereabouts. Thence the messenger repaired in hot haste to his residence, which happened to be some distance out of town; and meanwhile, the party at the chapel becoming impatient, other scouts were despatched in various directions. At length, it was ascertained that the worthy Registrar had left town by an early train, and as it was impossible that he could return in time, the wedding had to be postponed till the following day. The hitch, it appeared, had occurred through the Registrar having received no intimation of the day and hour of the intended marriage.

The absence of an official at the critical moment is not such a serious matter as the non-appearance of one of the contracting parties—a *contre-temps* which has often occurred in real life as well as in fiction. Though hitches of this kind have frequently arisen through the inconstancy of either of the principals, they have also been brought about by other causes, as, for example, by stress of weather. One morning in the depth of last winter, a young lady reached Inverness from the south, in one of the morning trains, intending to proceed to Wick in the 9.40 A.M. train. During the night, however, there had been a heavy snow-fall, and it was found that the line to Wick was blocked. On being told that she could not proceed, the young lady appeared to be greatly disconcerted, and immediately inquired for the station-master. 'Is there no possibility of getting to Wick to-night?' she asked. 'None,' was the answer. —'Not by coach?' 'No; not even by coach.' —'Nor by boat?' 'No; nor by boat.' —'Not by' — 'No; it is impossible: you cannot get there this week.' —'Well,' said the lady, 'this is awkward.' 'I'm sorry,' said the official. 'Will you be greatly inconvenienced?' —'Inconvenienced! Yes. I was to have been married in Wick to-night.'

Fickleness, on the part of both grooms and brides, has been a fruitful source of hitches at the altar. There is a story told of a rustic swain who, when asked whether he would take his partner to be his wedded wife, replied, with shameful indecision: 'Yes, I'm willin'; but I'd a much sight rather have her sister.'—An equally remarkable instance, which must be authentic, is narrated by a Bathgate minister. In this case, a hitch had occurred at the outset, through the absence of witnesses, and the bride herself had surmounted the difficulty by going for two friends, one of them being her cousin, a blooming lass, somewhat younger than herself. When, at length, the parties had been properly arranged, and the minister was about to proceed with the ceremony, the bridegroom suddenly said: 'Wad ye bide a wee, sir?' 'Oh, what is it now?' asked the exasperated clergyman.—'Weel,' replied the vacillating groom, 'I was just goun to say that if it wad be the same to you, I wad rather hae that ane'—pointing to the bridesmaid. 'A most extraordinary statement to make at this stage; I'm afraid it's too late to talk of such a thing now.'—'Is it?' returned the bridegroom, in a tone of calm resignation to the inevitable. 'Weel, then, sir, ye maun just gang on.'

The possibility of a hitch arising from a sudden change of inclination on the part of the principals, is ludicrously illustrated by the case of two couples who on one occasion presented themselves at the Mayorality in a suburb of Paris, to carry out the civil portion of their marriage contract. During the ceremony, one of the bridegrooms saw, or fancied he saw, his partner making 'sheep's-eyes' at the bridegroom opposite. Being of a jealous temperament, he laid his hand roughly on her arm, and said sharply: 'Mademoiselle, which of the two brides are you? You are mine, I believe; then oblige me by confining your glances to me.' The bride was a young woman of spirit, and resenting the tone in which the reprimand was made, retorted: 'Ah, Monsieur, if you are jealous already, I am likely to lead a pleasant life with you!' The jealous bridegroom made an angry reply; and then the other bridegroom must needs put his oar in. This led to a general dispute, which the Mayor in vain endeavoured to quell. The bridegrooms stormed at each other; and the brides, between their hysterical sobs, mutually accused each other of perfidy. At length the Mayor, as a last resource, adjourned the ceremony for half an hour, to admit of an amicable understanding being arrived at, both brides having refused to proceed with the celebration of the nuptials. When, at the expiration of the half-hour, the parties were summoned to reappear, they did so, to the amazement of the bewildered Mayor, in an altogether different order from that in which they had originally entered. The bridegrooms had literally effected an exchange of brides—the jealous groom taking the jealous bride; and the other, the lady whose fickle glances had led to the rupture. All four adhering to the new arrangement, the Mayor, it is recorded, had no alternative but to proceed with the ceremony.

The gentleman who so inopportunistically declared his preference for the sister of his bride, is only one of many who have made similarly eccentric replies to the all-important question. One hasty individual, on being asked if he would take the

lady by his side to be his wife, testily responded: 'In course I will; that's what I come here for.'—A Chicago young lady, on being asked the usual question, in which the words 'love, honour, and obey' occur, made the straightforward but somewhat too conditional reply: 'Yes, I will, if he does what he promises me financially.' On a recent occasion, an eccentric bridegroom, when interrogated in the usual fashion as to the acceptance of his bride, persisted in responding, to the confusion and bewilderment of the officiating clergyman, 'Yes, for a fortnight;' a declaration which was the occasion of no little trouble and perplexity, though the difficulty was ultimately overcome.—Many hitches of this kind are the result of misapprehensions on the part of ignorant people with regard to the nature of the questions asked and the obligations undertaken. In these cases, the adoption of some such brief and convenient formula as the following, which, though somewhat irreverent, is said to have been employed in the celebration of a marriage in Iowa, United States, would no doubt save a deal of trouble and annoyance to all concerned. The bride and bridegroom were told to join their right hands, and then asked: 'Do you want one another?' Both replied: 'Yes.' 'Well, then, have one another;' and the couple were man and wife.

A certain famous African explorer was once the victim of one of those extremely distressing hitches which amount to the complete and final separation of those who would otherwise have been united for better for worse. He had fallen deeply in love with a young Greek maiden whom he met in Crete. He afterwards declared that never, before or since, had he beheld so sweet and beautiful a creature. Having sought out the American Consul, he revealed to him the state of his heart. The Consul, who had himself married a Greek lady, bade him not despair, took him forthwith to the house of his *inamorata*, and presented him to her mother, who was a widow. The negotiations were conducted successfully; at the end of a week he was an accepted lover; and in a fortnight, the day for the wedding had arrived. All this while, he had seen the young lady once a day, always in the presence of her mother; and on the day before the intended marriage he had been permitted for the first time to take her hand and to imprint upon it a chaste salute. The hour appointed for the wedding found the bridegroom dressed for the ceremony and awaiting the happy moment. There enter to him at this juncture three Greeks, whom he has never seen before, and an interpreter, who introduces them as brothers of the bride-elect. They produce a parchment, which the interpreter explains. It is a deed of settlement, which binds the bridegroom to pay so much a year to the mother and to each brother, and so much to his wife, and to disburse the first instalments on the spot. In vain the unlucky traveller explains that he is worth nothing, and cannot pay. The brothers look daggers, the interpreter frowns; and the scene closes with the arrival of the Consul, who with difficulty gets his protégé out of the clutches of his importunate would-be relations, and ships him off to Athens. He never saw his beautiful Grecian maiden again.

Every one knows what a fund of latent mischief lies concealed in that little innocent-looking band

of gold, the wedding-ring, how it will mysteriously disappear at the very moment it is wanted, and what excitement prevails, especially on the part of the wretched groom, when it cannot be found. If the ring is all right, a dozen other little accidents may happen to delay or stop the ceremony. It is not often, happily, that a bridegroom so far forgets what is due to himself and his bride as to render himself unfit to take the vows through too frequent recourse on the wedding morn to the cup that cheers—and inebriates. On one occasion, an intending Benedick appeared in such a benighted condition that the clergyman was obliged to refuse to proceed with the marriage. A few days later, the same thing occurred with the same couple; whereupon the clergyman gravely remonstrated with the bride, and said they must not again present themselves with the bridegroom in such a state. 'But, sir, he—he *winna come when he's sober*,' was the candid rejoinder.

We will conclude with a case in which a somewhat serious obstacle to the celebration of a marriage was removed at the eleventh hour by the intervention of a beneficent flash of clerical jealousy. In a western Scottish town one evening there were so many marriages, that an unfortunate couple who had arranged to be united at the minister's house, were unable to procure a cab to convey them thither till long past the hour appointed; and when at last they stood at the door of the manse and rang the bell, it was approaching midnight. A loud and somewhat indignant voice presently responded from a bedroom window upstairs, demanding to know who was there. The situation was briefly explained; but the voice—that of the Rev. Mr W—, minister of the first charge of the Abbey Church—proved inexorable. 'I can't help it,' was the ultimatum received; 'you must just go home and come back to-morrow.' 'Oh, Mr W—, ye ken we canna gang hame without bein' married,' struck in a female voice.—'But what would you have me do? Call up the whole house because of your bungling?'—'Could you no dae't ower the window, sir?'—'Nonsense; it is impossible.'—'Oh, ye nicht, sir; ye ken we attend the Abbey on your day, and no on Mr B—.'—This final stroke of policy proved irresistible, for between Mr W— and Mr B—, minister of the second charge of the same church, there subsisted a good deal of professional jealousy. The window was put down, the gas lighted, the door opened, and the marriage of the triumphant diplomatists duly solemnised.

### THE ST GOTHARD TUNNEL.

OF the many unwritten chapters of history awaiting future historians, that which treats of the shifting of trade-centres will not be the least instructive and interesting. Hardly a decade passes without a new channel of international communication being opened, and simultaneously some old highway left to comparative solitude. Europe is dotted over with the sites of old commercial resting-places; towns once busy and prosperous, veritable trade-centres, now neglected and desolate, their streets grass-grown and deserted. Nor have the majority of these towns fallen into decay because of war, pestilence, famine, religious persecution, or statecraft, but simply from the ebb and flow of the commercial tide. For

example, the lumbering wain crossed some river where it was broad and shallow, and there our ancestors built a town. Then advancing knowledge threw a bridge over the narrowest part of the river, where the stream was deep and navigable; the road was thereby shortened; a second town sprang up, and the first was neglected. Later, a railway came, with its viaducts and tunnels, and carrying trade right away to some more favourable spot, created a third town, to the discomfiture of the town by the bridge and the town by the ford.

The completion of the St Gothard Tunnel opens a new European highway; and though it is not possible here to treat so important a subject with the consideration it merits, it may be permissible to glance at the probable effect of the opening of the new route next January upon one or two Italian seaports and upon Switzerland.

In the middle ages, the rivalry existing between Venice and Genoa was one of war to the death. The Queen of the Adriatic sought to monopolise the eastern trade, and for a time Genoa la Superba was forced to content herself with Morocco, Algerian, and coast traffic, together with as much of the western trade as Spain would allow her to pick up. But the discovery of America and the doubling of the Cape of Good Hope fell as heavy blows upon Venice. Directly it was understood that ships could sail right round to India, the Venetian route was discarded; all the drawbacks of the breaking of cargo in the unshipping, loading upon camels, and re-shipping, were perceived directly; and by reason of her geographical situation, Genoa scored the victory. From that period, Venice fell into the slumber of decay; and the venerable city, so hospitable in the days of its glory, liberal to art and learning, and foremost to generously encourage enterprise, seemed to be crushed beyond hope of regeneration. A few years since, a princely legacy to the Genoese, left by the Duke of Galliera, and which it was resolved should in part be spent upon the improvement of the dock accommodation of Genoa, awoke the Venetians from their lethargy. Rubbing their eyes, the Venetians saw that they stood fairly in the track of the coming stream of central European traffic flowing eastward. The Suez Canal was finished, the St Gothard Tunnel scheme promoted, and here was Venice as it were midway between the two. So a national subscription was started, the money to be used in repairing the quays and making new docks; and things were to be all made ready for the good time coming. Whether the subscriptions have flowed in as freely as the promoters of the scheme desired, we are not able to say, for in modern times the Venetians have exerted themselves little beyond attending to their devotions.

A glance at the map will show the advantage Venice has over Genoa in competing for Belgian, Swiss, and generally speaking, Central European traffic bound eastward. The golden tide is at her feet; it remains to be seen how she will profit by it. That a great deal of traffic will be diverted from Genoa, there can be no doubt; but time alone can show how far the good fortune of the Adriatic port will be the misfortune of Genoa. Thus, time and science have avenged Venice, and promise to restore to her something of her former renown, though poetic justice will not be com-

pleted by the stranding high and dry of Genoa as a commercial wreck; the port of the Riviera being secure in the South American trade, which Venice can never hope to touch.

Switzerland will gain immensely by the Tunnel. No matter what the destination of the traffic may be, it must traverse a considerable stretch of Swiss territory, and the tolls will be enormous. Moreover, when the projected water-way, to be made by the cutting of canals here and there, between Magadino on Lake Maggiore and the Po, is opened, the Swiss manufacturer of heavy goods will find a cheap means of transit at his very door.

As between the two Tunnel routes to Italy—the Mont Cenis and the St Gothard—for a Briton, there can be no doubt which is the better; the St Gothard route is the shorter and more picturesque, and should be the cheaper. Besides, from a tourist point of view, the St Gothard route has this immense advantage—it can be approached from several ways. From London to Italy *via* the Mont Cenis, there is practically but one route, through Paris; whereas, *via* the St Gothard, there are at least three grand routes—by Paris and Belfort, by Brussels and Luxembourg, or down the Rhine and on by Strasburg.

As a nation, the Swiss may well rejoice, but a chorus of lamentation is sure to ascend from a legion of hotel and diligence proprietors, though few travellers will be moved with much sympathy for either hotel or diligence worthies. The 'moderate terms' of the mountain hostelry invariably swell to immoderate dimensions by the addition of mysterious extras; while the printed tariffs of the diligence brigands are but too frequently barefaced impostures.

Tourists who are fond of adventure will find their field of enterprise but slightly restricted. Even should the Tunnel result in the practical closing of the St Gothard Pass, other passes are open to them. There are the Simplon—long threatened by the engineers—the Splügen, the St Bernard, the Furka, the Brunig, and several others, remaining to the ambitious climber.

But reverting to our first idea, while some few interests will suffer, others will be large gainers. The little town of Coire, or Chur—just as you like it, either French or German—being on the line of two or three passers, has a good transit trade with Italy and Germany, a deal of which it will certainly lose; a certain class of tourists, however, are not likely to neglect Coire, as it is a centre for Alpine excursions. Here and there are other small places, whose inhabitants are principally employed in tiny industries; these will have to depart—the chisel-carver, the stone-polisher, and the rest of them—and take up their abode elsewhere. Geneva hotel-keepers will not be particularly glad; but their brethren in Zürich and Lucerne already raise loud shouts of delight. The line of railway running along the north shore of Lake Lemman away up to Brigue, is sure to lose part of its traffic; but the lines running from the north-western and northern Swiss frontiers, from Bâle, Schaffhausen, and Constance, will be laden with the passengers and merchandise of Britain, Belgium, Holland, and Central Germany.

Directly and indirectly, the whole world will be the better for the Tunnel that is to be opened to the public next month; but one or two favoured

places will be the first to benefit. German Switzerland may be trusted to make as much as possible out of the undertaking, and if Venice is alive to her own interest, she will hasten to profit by the good fortune awaiting her.

Fifteen years ago, trade between Italy and Western Europe was either sea-borne or scrambled as best it could over the Alpine passes and along the Corniche Road. From Marseilles the railroad stopped at Nice, and between that town and Genoa diligences plied. From Turin the mail ran to Susa; there the traveller alighted and mounted the diligence, which took twelve or thirteen hours to cross Mont Cenis, the French railway terminus being at St Michel. Since that time, Italy has been joined to France by two great lines of railroad, both belonging to those immense Companies—the Alta Italia, and the Paris, Lyon, et la Méditerranée; now a third line, traversing Switzerland and drawing closer the bonds that unite Italy and Germany, is upon the eve of its opening ceremony.

#### A REQUIEM.

SING soft and low, with tender tone,  
A requiem for the Years gone by;  
With rains that beat, and winds that moan,  
We'll join in mournful melody:  
Chant to the wintry blast that raves  
So wildly over hill and plain,  
Weep—for to-night, from out their graves,  
Old joys come crowding back again.

Pile high the fire—keep out the cold;  
Lay on the board your festive cheer;  
Make mirth and music as of old,  
To welcome in the good New Year.  
The Old Year's brow was often stern,  
And harsh his lessons—as we know;  
But oh! we have so much to learn,  
And wisdom often comes with woe!

Where are the forms that used to sit  
Beside us in the firelight's blaze?  
Where is their laugh, their merry wit,  
Their noble worth, which sought not praise?  
Gone! Yet their presence seems to coo  
And linger with us round the hearth;  
They flit about us in our home,  
And share our sadness—and our mirth.

Oh, what a wealth of bliss was ours  
In those lost days, so quickly fled!  
What fragrance dwelt within those flowers  
Which seem so scentless now and dead!  
What blessed moments, cast away  
In spendthrift waste, we might have stored!  
What gentle memories for To-day  
Might have been ours!—a golden hoard!

Vain sighs o'er joys departed now!  
We'll grieve no more for vanished days,  
But forward press, with tranquil brow,  
And still our thankful song shall raise!  
Glad that so far our task is done,  
That Rest comes nearer and more near;  
That soon beyond this transient sun,  
We're sure to find a glad New Year!

## YULE-TIME IN SHETLAND.

BY AN OLD SHETLANDER.

I SUPPOSE most people know that Yule was the name originally applied by our Scandinavian ancestors to the great annual festival of the winter solstice, which they celebrated with feasting and revelry and wassail 'in commemoration of the return of the fiery sun-wheel.'

Shetlanders do not speak of Christmas so much as of Yule. Nay, more, if you were asking a native why Yule is kept as a holiday, the chances are that his reply would contain no reference whatever to the Nativity. He would simply say, it 'had aye been kept by the auld folk'—meaning his forefathers. Be that as it may, Yule is in Shetland the great holiday of the year, or at least was so when I was a boy. But Yule was not the 25th of December by the modern calendar, but the 6th of January; for in the 'melancholy isles of furthest Thule,' time was always reckoned according to the 'old style.' We were always, therefore, twelve days behind the rest of the civilised world. All that, however, is now passing away, thanks to steamboats and electric telegraphs and newspapers and general intercourse with the South; and I daresay Yule, the dear Yule I remember so well, will ere long be known and spoken of only as a tradition; for altogether life in those islands is now very different from what it was some fifty or sixty years ago.

But before giving you a little description of Yule in Shetland, as we kept it when I was a boy, a few prefatory notices of the circumstances and conditions of life in the Ultima Thule of those days, may not, I hope, be uninteresting.

In the time I am speaking of there were no roads in Shetland, and our remote northern island of Unst had very little intercourse with the outer world, except by a post-runner who passed, on foot, once a week between us and our metropolis, Lerwick, taking two days to traverse the distance each way. Two small trading schooners, the *Magnus Troil* and the *Norna*, ran

very irregularly between Leith and the Shetlands, making on an average five or six passages in the year. It was a great advance when an old rickety little sloop of some thirty or forty tons, which had been a cod-smack, was put on the passage between Lerwick and the north isles for a few months in summer; but during the greater part of the year, if one required to go from these north isles south to Lerwick, the only available means at command—unless he chose the overland route, which meant tramping over wild wet moorland hills, and crossing several dangerous ferries, where the tide runs at the rate of six to ten miles an hour—was by sea in a six-oared boat, which was expensive and often very perilous. Mails from the South arrived at very irregular intervals by the trading schooners, or some chance smack that might be coming north. There was no regular mail service until 1836, when a weekly steamer was put on for the summer months between Leith and Lerwick, calling at Aberdeen, Wick, and Kirkwall; and a packet schooner, between Aberdeen and Lerwick direct, during the rest of the year; but six weeks would sometimes elapse between the passages made by the latter.

It will be guessed that, thus circumstanced, we were thrown very much upon our own resources for necessary supplies of food and clothing. On the approach of winter, that is about the beginning of November, a bullock, a pig, and half-a-dozen or more of the small semi-wild native sheep, were slaughtered and cured. Everything was utilised. Tripe was carefully salted; black puddings, white puddings, and sausage puddings were made, together with some other combinations of meat and suet unknown, I believe, except in those islands; and the tallow was converted into candles. Ample stores of groceries of all sorts, meal and the like, were laid in from Leith; and thus preparations were made for the dark and dead half of the year.

Then as to amusements: there were, I need hardly say, nothing of the nature of theatricals, no circuses or strolling menageries—in fact, no

shows of any kind. Neither were there any fairs or wappinschaws. 'Highland games' were unknown, and there never was such a thing as a meeting of athletes to contend for prizes and local fame; neither were there ever any regattas or boat-races; and the native youth were utterly ignorant of cricket, shinty, quoits, golf, and even curling. Almost the only out-of-door game known, or at least practised, was football, in which boys and lads, and once in the year—on Yule day—many middle-aged men who had boys and lads of their own, engaged with splendid vigour and spirit. But of that more anon. It will thus be evident that in our remote and isolated home the routine life of each day was uneventful and monotonous in the extreme, except when perchance word would come, after a wild night of tempest, that some ship had been dashed to pieces on the rock-bound coasts and many lives lost or saved as the case might be. Little wonder, then, that Yule-time with its festivities, its feasting and its fun, was looked forward to by us youngsters with eager anticipation, and when it came round, was enjoyed with a zest, which it is not easy for dwellers in more favoured climes and more stirring localities to understand.

We formed a little family society amongst ourselves. First and foremost, there was my uncle the Laird, or, as he was invariably called, 'the Mester,' a staunch Conservative in church and state politics and social customs—a kindly, genial, hospitable soul—in a word, a fine specimen of 'a gentleman of the old school.' Then there was an elderly maiden aunt, who lived in a cottage by herself with an old female servant, who had been an institution in the family for at least half a century, one of those faithful and attached domestics now unfortunately becoming so rare. And lastly, there was my father the Doctor, with a big family of boys and girls, of whom I was neither the eldest nor the youngest. The three houses were as nearly as possible equidistant from each other—something less than half a mile. Amongst the three families, we managed to make the most of the festive season. Christmas proper, namely the 25th December, was 'kept' by us, the members of the other two families spending the day with us; and on New Year's day, Aunt Mary had us all at her decorous and kindly board. But the juveniles reckoned these as very mild and milk-and-water affairs. Yule, namely the 6th of January, was the great day, which, true to his conservative instincts and principles, my uncle celebrated much, I fancy, as it had been celebrated by our forefathers in the old house from time immemorial, and into which was crowded an extraordinary amount of feasting and mirth and innocent revelry. He also kept Auld New'r'day (13th January); and we, the boys, were always invited to his house for the week from Yule e'en till after Auld New'r'day; and didn't we just have a right royal time of it! You shall hear.

Certain very important preparations for the Yule festival had always to be made. We invariably got a new suit of clothes for the occasion—the cloth not unfrequently the gift of our kind uncle. But whether a gift or a purchase, it was always much easier to get the cloth than the clothes. It required a tremendous struggle to have our outfit ready in time. Our island, it is true,

could boast of a professional tailor who had 'served his time' in Lerwick, and understood his trade remarkably well. But Charlie was more than a tailor; and in fact, it was a very small portion of his time that he devoted to tailoring. He was by turns a boatman, a pilot, a fisherman in a desultory and erratic sort of way, a fish-curer, a ploughman, a carpenter, a barber, a bird-stuffer. At one time he would be shooting rabbits or hunting them with a collie by moonlight; at another, taming wild ponies; at another, breaking oxen to 'the yoke'; at another, away with 'the Mester' seal-hunting; at another, accompanying some traveller from the South on his rounds with a pack of merchandise or patterns. A veritable Jack-of-all-trades was Charlie; but an honest, faithful, trustworthy soul, and a great ally of ours. I don't know how we should have got on without Charlie. He was full of shifts and ingenuity, a man of infinite resources, and withal obliging and cheerful. He had, however, a notion that he was not robust, and that continuous application at his trade was injurious to his health—an exceedingly preposterous idea, and falsified by the fact that he still survives, a hale old fellow well past fourscore years; but it was a convenient excuse for off-putting. We therefore found it no easy matter to get a job out of his hands. A month or more before Yule, the materials would be conveyed to him, with many injunctions to set to work at once, and in earnest—a thing he never did. Every two or three days a visit would be paid, to see how he was getting on; but progress was provokingly slow. He never thought of serious work until a week before Yule, and then he did work night and day; and I am bound to say that we always did get the outfit on Yule e'en!

Another invariable and important preparation for Yule was the making of the football, Yule being always the inauguration day of the season. The bladder of the 'mert,' or pig, had been previously secured, carefully salted—very likely in an old brown teapot—and set away in the most remote corner of a cupboard. We shaped and sewed the leather covering ourselves; but to get the 'quarters' cut of the proper shape to secure a perfect sphere, which we considered a matter of the utmost importance, was an affair of great anxiety and study. We had certain rough rules for shaping the pattern, but were not always successful in giving it just the proper curve. The leather was not obtained from the shops, for two reasons: it cost us more than we could conveniently afford out of our slender pocket-money; and we found, or thought we found, that 'Scotch' shoe-leather—the only description procurable in the shops—was very spongy and too heavy; so the leather we used was native tanned—and, indeed, our boots and shoes were for the most part made of the same material. Some poor pony having met with a tragic end—tumbled over some precipice, or been murdered by a raven picking out its eyes, or smothered in a peat-bog—the skin was handed to a venerable fisherman, Magnus (or rather Maans) Manson by name, who was particularly skilful in a small way as a tanner. The bark he used was the root of a small yellow wild-flower which grows plentifully on light sandy soils in Shetland. The thinnest parts of the

tanned hide were always secured for our football.

A few days before the eventful day, we were on the *qui vive* of expectancy for the invitation from our uncle, which we always looked for, but were never sure of till it arrived; and we kept a very constant watch for the messenger. At last we would spy the little lassie coming across the fields. The note which she brought was delivered to our father, and commonly ran thus: 'MY DEAR —, We hope you will all spend Yule with us, as usual; and please say to the boys I shall be very glad if they will come on Yule e'en and stay till after Newr'slay.' While the note is being read, we are trying to look utterly unconcerned and unsuspecting, as though we had no idea that we had the least interest in its contents. Our father reads the note solemnly, and then turns to us and says gravely: 'Boys, this is a note from your uncle. He asks us all for Yule day, and he invites you to come on Yule e'en to stay till over Newr'slay. I suppose I may say that you will be very happy to go!' We make no verbal response—only a delighted smile, which he shrewdly interprets to mean he will be strictly correct in saying that, and very much the opposite if he does not say it. The messenger takes back the reply; and we bound across fields and dikes and ditches to see how Charlie is getting on.

Yule e'en arrives at last. Our brand-new suit, new boots also, and clean shirts and collars, and socks are carefully packed in our carpet-bag by the sympathetic mother's hand; and we transfer it and ourselves to our uncle's hospitable house, feeling very happy. Speculation is busy in regard to the prospects of the weather for the morrow, as, of course, very much of the pleasure of the day depends on the weather. The barometer is consulted; weather-wise folk are asked their opinion; and we fervently hope it will be fine. Presently, a substantial supper is discussed; and in a state of delicious excitement, suspense, and anticipation, we coil ourselves under the blankets, and try to sleep.

Long before the late day-dawn of those high latitudes, we are up and about, and in ecstasies of delight if—as I shall suppose—the morning is fine. The day's feasting begins about nine o'clock with a breakfast of the most substantial and tempting description. No porridge on Yule morning! The dining-room table is groaning with good things—a huge round of cold corned beef, savoury sausages, fried fish, eggs, rolls steaming from the oven, flour scones kneaded with milk and butter, a species of oatcake called 'fat brunnie,' so rich and free that they will scarcely hold together, jam and marinalade, and tea with plenty of sugar and rich cream. Our excellent and healthy appetites having got an additional sharpness by the keen air and exercise of the morning, we do ample justice to the good things before us. But before we rise from the table, we have yet to partake of the crowning glory of a Yule breakfast, and without which we should not look upon it as a Yule breakfast at all. From the sideboard are now brought and set before our host a large old china punch-bowl, kept expressly for the purpose; a salver, with very ancient, curiously shaped large glasses—also kept sacred to the occasion—and a cake-basket heaped with rich

crisp shortbread. The bowl contains *whipcol*, the venerable and famous Yule breakfast beverage. I do not know the origin or etymology of the name whipcol. I do not think it is to be found in any of the dictionaries. I do not know if it was a Yule drink of our Viking ancestors in the days of paganism. I do not know if there was any truth in the tradition that it was the favourite drink of the dwellers in Valhalla, gods and heroes, when they kept their high Yule festival. But this I know: there never was in the old house a Yule breakfast without it. It had come down to us from time immemorial, and was indissolubly associated with Yule morning. That is all I can say about it, except that I am able to give the constituents of this luscious beverage, which is not to be confounded with eggflip. The yolks of a dozen fresh eggs are whisked for about half an hour with about one pound of sifted loaf-sugar; nearly half a pint of old rum is added, and then about half a quart of rich sweet cream. A bumper of this, tossed off to many happy returns of Yule day, together with a large square of shortbread, always rounded up our Yule breakfast.

Almost immediately thereafter, football commenced. Most of our masculine neighbours, boys and lads, and men up to well-nigh fifty years of age, were wont to be invited; and when all were assembled on the spacious lawn, my uncle appeared, made a little congratulatory speech, and distributed drams to the seniors, and cake to all comers. Healths were drunk, and hearty Yule greetings exchanged; and then two—perhaps three—sets of players were arranged; goals were set, and the play begun. Our uncle and father looked on and watched with interest the progress of the game. When goals were changed, there was sure to be another round of drams, to keep up the spirit and energies of the players, and because, as my uncle would say to his well-pleased audience, 'every day was not Yule day;' and so the game went on fast and furious till close upon the dinner hour—three o'clock—when light failed.

The Yule dinner was as ponderously substantial an affair as the breakfast. My uncle always had a choice bullock well fattened and slaughtered for the Yule festivities, as also the best wether that his flock could produce; so there was no lack of fresh meat at this season; and somehow he never seemed pleased at those times unless he saw not only ample but lavish abundance on his table. Dinner usually consisted of soup, fish, roast-beef, boiled mutton, plum-pudding, apple-pie, tarts, jellies, and creams; followed by a dessert of fruit, oranges, apples, figs, plums, raisins and almonds, which—the dessert I mean—we youngsters relished most of all, as we never saw or tasted those delicacies except at Yule-time. The brief interval between dinner and tea was all the rest we had during the day; and by this time it may be supposed we were pretty well stuffed and used up.

But the proceedings of the day were not yet over. A number of my uncle's tenants in our neighbourhood, and their wives and sons and daughters, having been invited to a dance in the evening, they began to drop in about six o'clock. When all were assembled, a goodly company of honest fishermen, buxom matrons, stalwart lads, and blithe rosy-cheeked lasses, all dressed in their Sunday best, tea and cake were handed round.

Fredamen Stickle, a very prince of fiddlers, summoned from over the hill for the occasion, was elevated on a chair on the top of the dresser in the ample kitchen, my uncle's splendid Stradivarius fiddle in hand, and dancing began. Fredamen—or Frædie as he was familiarly called—was a born musician, and handled the bow with admirable ease, grace, and spirit. His grandfather or great-grandfather was a shipwrecked German sailor, who had married and settled in the island. Probably Frædie's German ancestry had something to do with his remarkable musical tastes and talents. I have a vivid memory of Frædie sitting on his elevated perch, his head thrown back, his bright light-blue eyes sparkling, and his handsome, mobile, and expressive countenance beaming with smiles of delighted excitement, while his right hand swept the strings with well-rosined bow, and his right foot beat loudly the splendid time like a drumstick. The man's spare but lithe and sinewy body seemed to be transformed into a musical machine; and the music was the most inspiring of its kind I have ever listened to. It was irresistible. It compelled the dullest and the weariest to take the floor *nolens volens*. Quadrilles, waltzes, polkas, and the like were unknown and unheard-of dances in those remote regions. But reels and strathspeys, country-dances and jigs, followed each other in quick succession until eleven o'clock. Then a substantial supper was served, concluding with some rounds of potent punch. But there never was anything approaching to what may be termed excess. 'Health and good-night' was drunk, the invited guests dispersed, and we tumbled into bed; and so Yule day ended.

For a week the feasting continued—the football by day and dancing at night, with sometimes a rubber at whist; for, young as we were, we had learned the noble game, and were keen and by no means bad players. The Yule festival came to a conclusion on New Year's day, 'old style,' January 13th, which was celebrated by a slightly modified repetition of what I have endeavoured to describe as the Yule-day festivities.

Ah me! in writing these reminiscences I have seemed to live over again the happy joyous days of the old time; and as I lay down my pen, I cannot but think of the changes that have since taken place. How many of those dear ones that made Yule bright and glad some have passed away—uncle, aunt, father, mother, and others of the family circle, all gone; and those who still survive, the youngsters of those days, scattered far apart. Moreover, life in all its aspects, conditions, and circumstances has materially changed. Now there are roads and wheeled vehicles all over the islands. A powerful and commodious steamer plies between Lerwick and the North Isles once, and sometimes twice, a week throughout the year; and several are engaged in the regular trade and carrying the mails twice and, for part of the year, thrice a week between Lerwick and Leith. And yet more, the telegraph wires have brought the inhabitants of the most northerly of the Shetlands into immediate communication with the rest of the world. The 'new style' is superseding the old, and Christmas taking the place of Yule, which latter I sadly fear will soon be known only as a tradition.

But after all, will the generation that is now

in its sprightly youth be happier for all these changes than we were? I don't know. We had manifold compensations. Chief of these, we were all in all to one another. We knew from experience all that is implied of sweetness and tenderness and sacredness in that choicest of characteristic English words—*home*. Ours was indeed a happy home; and looking back over the many long years that have elapsed since we all lived together in peace and happiness, I can truly say, that next to the holy lessons we learned from the lips of a saintly mother, my brightest memories are associated with 'Yule' in the 'Old Rock,' as we fondly term those isles of our nativity.

## THE COUNTER-SYNDICATE.

### CHAPTER III.—CAGING THE BEARS.

SOME time had elapsed since the foregoing symposium at Mr Quick's, when one morning the speaking-tube which communicated with that gentleman's office and the *sanctum* of his employers, announced that Mr Fox desired to see Mr Quick. Immediately afterwards the confidential clerk stood facing the three partners, who all seemed discomposed, and had a pile of letters and telegrams on the table before them.

'Mr Quick,' said the senior, with a singular hesitation of manner and unsteady voice, 'we have decided to consult you in a matter of very great gravity.' He paused, looked at his partners, then resumed: 'You are aware of the high opinion we have of your integrity and judgment; and we are desirous of showing a deeper appreciation of your fidelity and acumen. You know that great commercial houses, like great empires, have diplomatic arrangements which are intrusted only to the highest personages.'

Mr Fox again paused; Mr Quick bowed.

'What I may call the vital part of our business has been attended to by ourselves, although much of a secret nature has been allotted to you. Mr Smiles, as you understand, keeps the strictly private ledgers, and attends to the special correspondence. He desires your assistance in these matters. But beyond these, we wish your co-operation in an affair that has assumed an aspect of a quite unexpected kind. You are aware, Mr Quick, that we have sold coffee largely during the past two months?' This assertive query was ejaculated with a fevered eagerness, strangely in contrast with the previous part of his speech, and was followed by a look of undisguised anxiety. Messrs Smiles and Naylum turned uneasily in their chairs, and looked at the confidential clerk so fixedly, that he felt embarrassed.

'Do I understand that I am to change from my department to another?' asked Mr Quick, really not knowing what to say.

'No; that is not it,' returned Mr Fox, still more anxiously. 'We want to place our whole confidence in you.'

'What do you mean, sir?'

'I mean, we desire to reveal to you the actual position of the firm—in short, to treat you as if you were a member of it.'

These last words produced a singular whirl in

Mr Quick's brain. He almost staggered against the table near which he stood.

The three partners surveyed him with mixed emotions.

Mr Smiles now spoke: 'If we reveal to you all the private concerns of the house, it can only be on the condition of making you a partner. No servant, however esteemed and trustworthy, can be admitted into the very core of our business. Only a man bound equally with ourselves to the uttermost can share our secrets. Mr Fox should have prefaced this interview by what I am now saying. Several months past you asked for a small share in the firm. We are now prepared to treat with you.'

Mr Quick became pale. He did not reply.

His employers looked at each other, at first with astonishment, then with alarm. Mr Naylum, who was of a suspicious nature and rather explosive temper, rose from his chair. 'Do you hesitate, Mr Quick?' he demanded sharply.

'I do,' replied the other, regaining command of himself.

'Why?' cried the partners simultaneously.

'Because, gentlemen, it is out of my power to join you.'

Confusion, indignation, and dread marked the features of the trio, according to their respective temperaments.

'Explain yourself,' said Mr Smiles, stepping towards the clerk, and giving a significant glance for silence to his friend Naylum.

'I will, in a word,' replied Mr Quick, now perfectly at his ease. 'I am about to found a new financial house myself.'

'Yourself!' echoed Mr Naylum scornfully.

'Myself and a few others.' This very coolly. 'I am not without friends, Mr Naylum.'

How easy it is to make bad worse by hasty speech! How hard to erase the impressions we write upon the consciousness of those we are in contact with. Scorn, insult, assumption of superiority, are never forgotten by those we seek to dominate. The bias we give to another mind goes on, in spite of after conciliations and atonements. A scar remains after every physical wound, and the mind still more effectively registers its lacerations.

'Your conduct, Mr Quick,' cried Mr Naylum, in a rage, 'is simply disgraceful; and I shall not fail to say so to all our connections. You wait for Mr Fox to put you in possession of our most important transactions, and then you turn round to take a mean advantage of us. I repeat, your conduct is disgraceful.'

'I add to the remarks of Mr Naylum,' said Mr Fox interposing, 'that no honourable man would have allowed any revelation of a firm's affairs to be made to him, when he was on the eve of starting a rival house. The commonest courtesy, to say nothing of the debt of gratitude you owe to us for countless benefits received, ought to have elicited from you a frank avowal of your intentions.'

'It behoves me to say that I fully indorse the opinions of my partners,' said Mr Smiles, emphatically bringing his right hand upon his left palm. 'Your behaviour is a mixture of dishonour, chicanery, and overreaching. That it will tend to your worldly advantage is possible, for honesty does not always succeed in

competition with dishonesty. I am sure my partners will agree with me when I say, from this moment you can no longer remain in our service.'

'Certainly not!' cried Mr Naylum impetuously.

'You are right, Smiles!' said Mr Fox warmly.

'It was only yesterday that I arranged my future,' Mr Quick returned, as calmly as rising indignation would permit. 'I should have told you in due course. Your proposition has precipitated matters.'

Mr Naylum grinned incredulously. Mr Smiles held up his hands, as if for silence. Mr Fox shook his head, like a man denouncing silently an immorality he did not wish to waste words upon.

The clerk did not heed these expressions. In a voice that grew harder and more cutting as he proceeded, he said: 'I owe you no gratitude. I have served you for a salary that was the bare equivalent of my worth. My work and your wages balance each other; therefore we are quits. If I taunted you with ingratitude, you would consider me a presumptuous fool. Yet I have as much right to brand you, as you have me. That I fully deserved my stipend, is admitted by you all, as you sought to place me on an equality with yourselves. Self-interest, not benevolence, induced you to advance me to the position I have held. Self-interest again has induced you to inveigle me into a partnership.'

'Inveigle!' ejaculated Mr Fox.

But the clerk in the warmth of his denunciation heeded him not. 'Only to serve yourselves, did you ask me to share the business. Permit me to recall the fact, that I first proposed a partnership. I have not forgotten the scarcely veiled contempt of Mr Naylum in reply to my request; nor the dignified amazement of Mr Fox; nor the bland disdain of Mr Smiles. In despising my association, you roused all the pride and energy of my soul. I determined to win advancement outside of the office, as I was forbidden to advance within it. I had confidence in my own gifts and experience as a business man; and I was sure my commercial foresight and grasp of finance was at least equal to yours individually. Nay, I will be candid enough to say I felt myself more than a match for the combined firm.' Here he sneered so witheringly, that Mr Naylum grew livid.

Again he went on. 'Do not suppose that I wished to take any advantage of you. I knew that I could advance the house to a pinnacle of financial greatness beyond anything known. I would have enriched you beyond your dreams. With scorn and contempt I fling back your paltry insults. I am your superior in the great game of finance, and this coffee operation is my evidence of the fact. You know how you stand in that wretched business, and so do I!—smiling contemptuously. 'Poor blunderers! I do owe you gratitude for enabling me, by the side I have taken, to show you that I am your master.'

Mr Naylum could endure it no longer; he sprang up furiously and ran towards Mr Quick, as if to strike him. Both the others seized him, and for a few moments a most unseemly fracas ensued; one that would have been deemed incredible in the City. When calm was in a

measure restored, Mr Fox, dreadfully agitated, said: 'I fear we have been harbouring a viper in you, Mr Quick. You have been plotting against us.'

'No doubt about it,' roared Mr Naylum savagely.

'I am no viper, no traitor. I have sought by knowledge and judgment to gain what is my right as much as yours—financial success. But as you set the example of vilification, I declare you all and each to be knaves, who, by a new species of confidence-trick, want to escape the penalty exacted from fools.'

'Quick!' screamed the senior partner, 'how dare you say such words in my presence! Knaves!'

'Begone, villain!' foamed Mr Naylum, ghastly with passion.

'Leave the room!' commanded Mr Smiles, with a sublime expression of disdain.

'When I have done,' replied Mr Quick with incredible *sang-froid*. 'I will finish what I have to say, either here, or in the counting-house in presence of the clerks. They shall have my version of the cause of our separation. If you eject me from the premises altogether, I will go straight to the Royal Exchange, and there, before the world, vindicate my conduct, and expose yours to the derision and obloquy it merits.'

The crack of doom could not have produced a more terrible shudder than that which thrilled through the partners at this last appalling threat. Under it Mr Naylum lost the hot flush which made his ordinary florid face glow like a sunset. A cadaverous pallor made him almost unrecognisable. Mr Fox sank half-fainting in his chair. Mr Smiles sat staring at the clerk, fascinated with terror.

'I call you knaves to your faces, and I have no hesitation to call you so before the citizens of London. I undertake all the penalties of my words. For what else are you, who try to seduce me into partnership with a house bankrupt beyond redemption! I repeat the word—the firm of Fox, Smiles, and Naylum is utterly ruined!'

It was pitiable to observe the deadly prostration which came over the partners as the ringing merciless voice thundered out the last sentence. A malignant, remorseless demon seemed to be revelling in their awful downfall. Yet, to an uninterested onlooker, there was no evidence of gloating denunciation in the behaviour of the stern man addressing the cowering trio. Mr Quick was angry, and felt himself in a masterly position, and naturally took advantage of it; that was all. The sickening dread that he was speaking the truth was the real cause of the alarm possessing his hearers.

Several minutes of supreme anguish intervened. Mr Fox was the first to recover command of himself. Turning his haggard face to the clerk, he said faintly: 'I do not seek to disguise from you, Mr Quick, that we are in a difficulty, a great difficulty. But I solemnly declare that none of us had any intention of involving you in it. Our position is not so desperate as you suppose. We have been grossly infamously deceived by Geldmacher of Hamburg, who has almost succeeded in detaching the Grosschnabels from our connection. We know you have by

some means obtained considerable influence with them, and we sought to enlist that influence on our behalf. I own with profound regret that we made an irreparable mistake in refusing to take you into the house. You are certainly possessed of commanding abilities, and we were blind to our own interest in ignoring them. After this most tempestuous exchange of personalities and revelations of hatred, of course further amity is impossible between us. No doubt, you will do hereafter as much against us, as you have benefited us in the past. For my own part'—here his voice gave way, and a look cunning, deprecating, sorrowing, gleamed towards the iron face of the clerk—'for my own part, I shall feel in losing you that I am bereft of half my brain. I wish you success cordially; and if it be in my power to forward it, be sure nothing that has taken place this morning will prevent me helping you. Young houses are difficult to build in London. Although you deserve to prosper, you may fail; and in such an event, our old relations may be renewed.' He stopped, and with more assured eyes raised towards the clerk, who stood in icy calm, waiting for a sign.

Mr Quick simply inclined his head.

Professing to be encouraged by this, Mr Fox went on with an oily subserviency, artfully blended with ingenuous confidence: 'Before closing this conversation, I venture to place before you the request I had to make at the outset; and I do it with full confidence in your magnanimity. We stand as declared foes; at least, you are hostile to us,' he stammered, as the rigid face before him became harder at these words. 'Yet I am sure you would do us a service, after all that has occurred, if by so doing no injury came to yourself. I am not too proud, indeed, to throw myself upon your generosity, and I here ask your mediation with Grosschnabels. If they continue faithful, all will go well. Mr Quick, I beseech your aid.'

The clerk seemed to rouse himself from a deep meditation. Messrs Smiles and Naylum recovered something of their wonted aspect. There was a shade of regret almost in Mr Quick's voice as he said: 'I cannot help you, Mr Fox. Do not suppose me a churl, delighting in doing an evil turn. What I said in a heated moment, I now repeat in calmness—Your house is ruined. The Grosschnabels are no longer with you!'

'Gracious powers!' exclaimed Mr Fox, as if struck by an unseen blow.

'Impossible!' cried Mr Smiles, clasping his hands.

Mr Naylum said nothing, but became ashy pale again.

'No earthly power can prevent the crash which has been culminating in the past three weeks,' went on Mr Quick, really touched by the smitten men before him. 'Mr Steinberg of Frankfurt and Mr Lupus of Philadelphia hold your paper at this moment. Grosschnabels are absolute detached neutrals. De Predateur and Coutail have also made a *volte-face*; and Bellamy of Boston holds Bulldose Brothers between finger and thumb. Before a week has passed, the rout will be complete.'

Groans of uncontrollable anguish burst from the unhappy listeners.

Almost compassionately, Mr Quick hastened

to say: 'I advise you to take instant action to defend yourselves against the last blows aimed at you. The markets are becoming convulsed beyond anything known; save what you can.'

With this he left the room.

### BYRON-LAND.

It has come to pass, in these days of fast travelling, that there are comparatively few places unknown to the tourist. Not very many years ago, a man was considered as tolerably enterprising who had spent his holiday in tramping through Scotland or Wales, or, at the very farthest, some parts of Switzerland. The tourist of to-day despises such small ventures; they are good enough for beginners, but to go farther afield is their aim, and to 'do' Norway, or Egypt and the East. Mr Whymper has set an example in climbing Chimborazo, which others will attempt to follow. Soon we may hear of a human tide, 'personally conducted,' setting westward for the chain of the Andes; and those hitherto solitary giants looking out upon the Pacific, will be alive with tourists.

But all men cannot accomplish so much. Many who have not time or money would like to make the acquaintance of foreign lands and peoples. Some are happy and content to find out that which is interesting and beautiful at home, and for such modest wants there is an inexhaustible supply. To which of these classes I belong can be of no importance; but it so happened that in passing through Nottingham a short time ago, I had a day to spare—to do with as I liked. It was a chance not to be lost. The next train up the Leen Valley found me bent on a holiday visit to the realms of the poet Byron.

After a slow journey of seven miles, I felt the train slackening speed opposite a most dismal-looking colliery, and shortly after, we came to a standstill at the village of Hucknall-Torkard. No description can do justice to its utter unloveliness, and want of what is perhaps most looked for—poetry. Briefly, it is one of the most straggling, patched-up, dirty villages in England, with colliery chimneys on the outskirts belching forth thick smoke, a population almost entirely of miners, an infinite variety of smells, and evils innumerable. And yet it was not always so, for the ancient forest of Sherwood once covered all the land around for miles, where Robin Hood and his merry men hunted their prey, and made havoc with the king's deer. Was not one Stutely a member of their jovial band? Well, an old joiner told me that the name was common in his time, but the last of them—with a touch of his noble ancestor in him, perhaps—had thrown up the trammels of citizenship, and gone away with Bentinck's Light Horse. The village still boasts its Wagstaffs and Hardstaffs; but it is needless to say the weapon which rendered their names famous is out of use. One of the former, indeed, wields the more peaceful drumstick with some skill; and if the Beardalls were as common in the days of the quarterstaff as they are now, and worthy of their name, the latter weapon must have been brought into frequent use.

Following the main road towards Kimberley, I saw the mansion where the Byrons lived before

the one of them with the big beard received Newstead from the stout old robber King Hal. The door being open, and hearing some one moving about inside, I stepped on to the threshold and knocked. Presently, a sleek-faced maid-servant appeared, and cautiously getting the door between me and the interior, without giving me time to state my business, told me that the master was in the fields. Clearly this was an unfortunate beginning. I felt in my own mind that I was regarded as suspicious; and, moreover, from the girl's stolid face, that any attempt at a parley would be time wasted. Nevertheless, with a joint hope of disarming suspicion, I asked in my best possible manner if she knew anything of the Byrons, or of Colonel Hutchinson who had once lived there. She gave me a very decided 'No,' and settled the question sharp; so I retired. Further than that Colonel Hutchinson the Parliamentary undoubtably lived there, I know not; but in a field adjoining the village, I beheld the spot where the Royalists and Roundheads once had a Stuart brush, and where many of the 'King's Own' came to earth before the solemn-faced Puritans.

Making my way across the fields—through the charming old village of Lynby, with its May-pole and stone cross—I reached Lapplewick. From this point, woods of beech, and elm, and pine overhung the road, and then opening out at a considerable elevation, revealed a beautiful landscape. Newstead lay below in the valley, under the slanting rays of the sun, and the light smoke from its chimneys curled up lazily among the woods, on a background of gray and purple cloud. What grand old giant is this stretching his long powerful arms on each side of the entrance-gate, and challenging intruders? An old-world king of the forest—the only one that has escaped the ravages of time and the axe. When the fifth Lord Byron cut down all the timber on the estate, this oaken monarch was bought by some gentlemen of Mansfield, and afterwards presented to the poet. Long may it reign!

Descending into the valley by the carriage road—which at first is shut in by spruce-firs, then opens out into more domestic and park-like scenery—we come at last in sight of the venerable old Abbey, which has stood since the time of Henry II., and become dear to Englishmen through its rich and varied associations. Nothing can be more delightful than this secluded, fern-clad valley, with its adornment of woods and lakes. In front of the house is the 'Stew Pond,' fringed with yews, where many a fine fellow, I expect, was fattened for the monkish tables. Beyond is the grove dedicated to the memory of the 'wicked' Lord Byron, who despatched his neighbour—Mr Chaworth—so mysteriously at the *Star and Garter* in Pall Mall. If ever you visit Newstead, you are sure to hear of that grove. It is a dismal-looking place, and seems, moreover, to have a certain mystery of its own. Perhaps it is inhabited by a ghost; but I saw nothing except two leaden statues of Pan and a female satyr, which the country-people looked upon as the wicked lord's demons. In the midst of such disreputable company, I was surprised to see a fine healthy tree growing, on which the poet had carved his own and his sister's name during his last visit to Newstead.

Retracing our steps—for the gardener had now taken me under his care—I entered the precincts of the chapel. Here the silent old labourer called Time has been at work while generations of men have come and gone. He has destroyed, but not out of wantonness. He has given us, perhaps, full measure for that which he has taken away. No vaulted roof or solemn aisle resounds with the rich harmony of voices now, but instead, a carpet of the softest grass, and shrubs and stately trees. No stained glass is in the Gothic window—which alone reminds us that the place has been other than it is—but mantling ivy clings about its naked form, and clothes it with unfading green. Close by is the tomb of the never-to-be-forgotten 'Boatswain,' Byron's favourite dog.

Again I say, this old Abbey of Newstead is very beautiful. If any one takes an interest in things old and poetic and lovely, let him visit it. Here at 'Newstead in Sherwood' Edward I. granted a charter to John de Annesley. Here Cardinal Wolsey stayed on his last sickening journey southward; and here too, in a bed which they show you, slept the redoubtable hero Oliver Cromwell. The poet, writing of that eventful time, says:

• The Abbey once, a regal fortress now  
Encircled by insulting rebel powers;  
War's dread machines o'erhang thy threatening  
brow,  
And dart destruction in sulphureous showers.

As we walked through the dim and sounding cloisters to the poet's bedroom, I was forcibly impressed with their fitness for a ghost's walk; and on mentioning the fancy, was informed that recently, if not now, a 'goblin friar' did indeed haunt them, at night-time, and had actually been seen by Byron.

It was no mouse, but lo! a monk, arrayed  
In ~~black~~ and beads and dusky garb, appeared,  
Now in the moonlight, and now lapsed in shade.

Of all the interesting places in the Abbey, the poet's bedroom is undoubtedly most so. It stands now, as it did when he inhabited it, small, dark, and plainly furnished—the same in all respects save that the master-spirit is gone.

To return to Hucknall once more and its church, the last resting-place of the poet. It is anything but a beautiful fabric, and as unlike the burial-place Byron would have chosen as one could well imagine. A marble slab had just been received from the Byron Memorial Committee, which was sent together with the pediment of the statue from Greece. This slab, which is about twenty-seven inches square, with a wreath of bay leaves let in in brass, and the date of his birth and death, is placed in the chancel directly over the poet's head. On the wall hung two faded wreaths, one of which was placed there by the Bishop of Nottingham.

Before coming away, I looked into the visitors' book. The old one, which contained the names of Bowring, Thomas Moore, and Washington Irving, together with many other celebrities, has been lost. From a copy in the possession of Mr James Widdowson, the most hospitable of churchwardens, I judge it to have been very interesting. The spirit of the place seemed to have evoked

many a song, among which those of Bowring, Justice Williams, William Howitt, and a few others, are of a chaste and lofty kind. The present visitors' book, which is rapidly being filled, contains the names not only of Englishmen, but very many Americans, besides others from the most distant parts of the world.

Byron's life and poetry have hitherto exercised an almost magical influence over others in absorbing, as it were, their intellectual being. After his death, a lady came to Newstead, and took apartments at one of the farms belonging to the estate. Who she was, further than her name indicated, and where she came from, was never known. Her sole pleasure consisted in rambling about the Abbey grounds and holding communion with the spirit of him who had consecrated that place unto her, and made it her chief joy. From her small stature, and habit of dressing in white, she came to be known as the 'little white lady,' and as such she is spoken of now in her resting-place, which is separated from the Byron vault by the church wall only. Washington Irving gives a detailed and somewhat romantic account of her. Certainly she was accomplished, and could write with much taste and elegance. Again, only a year or two ago, a lady, who had resided in Mexico, came to Hucknall-Torkard, that she might live and die by the side of Byron.

As we turn to leave the church by the chancel door, a stream of light pours in through the window, and rests over the head of the poet sleeping beside his mother and his daughter Ada. The stillness of eventide is over everything, and there is a great calm. See, yonder is the grove swathed in a bluish film:

Standing upon a hill, a gentle hill,  
Green, and of mild declivity;

where he walked in the morning of his days with Mary Chaworth, and first tasted of that great bitterness which ceased only with his life. Everything speaks to us of him, but it speaks only peace now.

## A DOCTOR'S STORY.

### CHAPTER I.

It was a summer evening, and I was standing in front of my consulting-room door, rattling a bunch of keys, after having locked up, ready to repair to my bachelor establishment. I believe I was then considered a rising young physician in our quiet little town, in one of the States of America. At anyrate, I had patients enough to warrant a respectable office down street, and a luxurious suite of apartments in the best boarding-house the town could afford. Well, I was, as I said, rattling my bunch of keys; and my friend, Horace Bertram, was standing near, wondering, I suppose, from the way he looked at me, what I meant to do next. I was the first to break the silence.

'Do, Horace, come over to my lodging and stay with me to-night. I always feel so lonely, somehow.'

'I have no doubt of it, Wilfred; for you're a man with great social qualities. Glad to come, old boy. But why do you wear out all your best days by yourself? Why don't you look out for a better-half, to brighten up that smoky den of yours?'

'I'm afraid she might prove my worse half, Horace. I am not one to make a leap in the dark, I can assure you. I have the highest respect for the fair sex; but there are exceptions to every rule, and a man must look twice before he plunges into marriage.' Just as I was saying this, I noticed two young ladies coming along in our direction.

'Hush, Wilfred,' said Horace; 'here come two of our angels now, and I happen to know them. Isn't it a fine thing to be so fortunate as to know everybody in town?'

They were ladies of cultivated tastes—one could judge that much from their dress; for I was very observant of the minutiae of a lady's costume. They had been shopping too, that delightful occupation of the gentler sex. As they passed us, I caught a few snatches of their conversation. The taller and more queenly looking of the two was remarking to her companion: 'I tell you, Jessie, I cannot do it; it would not be right. I must do my duty.' She was speaking, I could see, very earnestly. They looked up as they passed us, and nodded in a friendly manner to Horace, who uncovered his curly brown head; and we both bowed politely to two of the fairest specimens of womanhood. Then I caught a glimpse of the face of the stately lady who had such decided notions of right and wrong. I could see the pleased smile that flitted over the childish countenance of her companion, as Horace lifted his hat to them; and I also noticed the flush that mounted even to my friend's high forehead; so I put these two incidents together, and drew my own conclusions. But that was all I did notice, for I was completely absorbed in the statelier lady of the two who had passed us. The light of a pair of clear gray eyes had for one moment rested on mine, and I had had one brief glimpse of a true, earnest face, that haunted me afterwards like a dream. Horace's voice roused me from my momentary feverie.

'Building air-castles, are you?' he said. 'Well, then, my dear friend, just let me give you a piece of advice. When you people that mansion of yours, don't attempt to convert either of those two into the "lady of the manor."'

'Why, Horace? Who are they? Where do they live? And what relation are they to each other?'

'Gently, my friend, gently. One question at a time. Why? Because those are "ladies of high degree," and very much above such poor human beings as Horace Bertram the lawyer, and Wilfred Lansdowne the doctor. I rather like that little gipsy, Jessie, myself.'

'I did not need to be told that,' I said. 'Your face is a good index to your heart. But you haven't answered the most important question of all. Who are they?'

'I was coming to that when you interrupted me. They are the daughters of Sir Gerald Wyatt, an enormously wealthy Englishman, who came over to the States here a few years ago for his health. He has only two children—Lucille and Jessie.'

'Then to whom will the title and estate revert, upon the death of the present owner?'

'To a distant cousin of his own, his only living male relative. He has never seen this cousin; but Sir Gerald has made inquiries in England,

and hopes soon to discover traces of his expectant heir. Madame Rumour has furthermore informed the listening public that should this cousin prove a single gentleman, Sir Gerald intends that his daughter Lucille shall marry him, in order that she may be My Lady, and that the property may remain in the family. But one needn't listen to all that is said. I'm very glad Jessie didn't happen to be the elder.'

'Where did you say they live?'

'I haven't said at all yet.—Why, Wilfred, how absent-minded you are! But I'll tell you now. They have leased a villa in the suburbs called the Towers—a perfect paradise.'

We had reached my boarding-house by this time, and Horace surprised me by saying: 'You're in such a queer humour, Wilfred, that I think it would be better to leave you alone for to-night, and spend an evening with you some other time. So good-night, and pleasant dreams of the queenly Lucille.'

He was right. I did not feel like entertaining any one. I repaired to my cosy sitting-room, and throwing myself on the lounge, was soon absorbed in exciting and perplexing thoughts.

I was the distant cousin of whom Horace spoke. I had not known until this moment that my relatives were anywhere near me. And now, the face of the very one for whom the unknown cousin was destined had struck my fancy, and was so indelibly impressed upon my mind as to defy all efforts at effacement.

This Sir Gerald Wyatt had loved my mother, when the two were scarcely more than children. They were cousins. But, after that, as my mother had often told me, they became separated; yet Sir Gerald had never forgotten the love of his young manhood. To dissipate his grief at the kindly but decided refusal he had received, he went to travel on the continent. Years elapsed before he returned, and when he did so, he brought back a beautiful Italian bride, to reign as Lady Wyatt over the home of his ancestors.

While he was absent, my mother married my father, to whom she had been long secretly attached; although, in point of social position, he was not quite her equal. Immediately after their marriage they proceeded to America, where my father, who was, like myself, a physician, had hopes of securing a better practice than in the home country. But a few years of fruitless endeavour to get a good start in business, broke his spirit, and unluckily he gave way to habits of intemperance. While in this condition, he had the misfortune, in prescribing for a patient, to make a fatal blunder, which cost the patient his life; and for this my father was apprehended and imprisoned. But while awaiting his trial, he died; and thus left in poverty and obscurity, my mother and I returned to our English home; and as she was too proud to let her rich relatives know of her situation, she changed her name, buried herself in a humble village, and devoted herself to her boy's education. When I was about eighteen years old, my darling mother's weary eyes closed in their last sleep, and I was left alone in the world.

Every tie that bound me to my native country having been severed at my mother's death, and being of too independent and proud a nature to make myself known to my titled relatives, I

returned to America—the welcome refuge of all free spirits. Determined that I would not let life conquer me, by my own exertions I managed to procure a medical education, and then settled down in this lovely little spot.

It was easy, therefore, to understand that Sir Gerald Wyatt had great difficulty in ascertaining the whereabouts of his cousin's child; for though he may have ascertained the name of the man whom she married, I had never adopted that name, and was not known to any one by it. For many years, indeed, he had not troubled himself about the matter, being absorbed in the love of his beautiful wife; and it was only when the latter, transferred to the colder climate of England, drooped and died, leaving him no male heir on whom he might bestow his title and estates, that he remembered his cousin, my mother, whose son, if still alive, would be his nearest male relative. He was thus far, as I understood, in search of this relative; and here was I within a mile or so of him, and he did not know it.

But I did not mean to reveal my identity as yet; my plans were soon and easily made. I concluded to go on in the same quiet way, till chance should throw my relatives in my path; and in the meantime find out all that I could of them. Since I had seen Lucille, my head was filled with romantic notions, but I nevertheless determined that in the meanwhile my relationship should remain unknown to her.

#### CHAPTER II.

I was again walking home one evening some weeks afterwards, when Horace Bertram—to whom I had not revealed my relationship with the wealthy Englishman—met me, and told me a startling piece of news.

'I say, Wilfred, the English cousin has arrived. They've killed the fattest calf over there at the Towers, for the old gentleman is convinced that he has at last discovered the missing man.'

'You don't tell me so! Why, that cannot be—it is utterly impossible!'

'I wonder why it cannot be just as possible as the fact that Miss Lucille is going to marry this very same cousin.'

'How did you learn all this, Horace?'

'Don't look so white and solemn, man. I never thought it was so serious a matter. Why, you see, I met Jessie at Mrs Jackson's last night, and she told me all about it. Lucille is terribly distressed, for she has taken an unaccountable dislike to her cousin. But her father will have his own way, the stubborn old fellow.'

'But can't you,' I asked, 'tell me something more about this cousin?'

'Nothing more, scarcely, for we had so much else to talk about. Only that he is very handsome, and Sir Gerald is completely taken with him.'

'Did you hear his name?'

'It is Guy Radcliffe, I believe.'

Radcliffe was my father's name, and whoever this cousin was, he must have learned something or other of our family secrets. I felt staggered and dazed, and my friend noticed it, but lightly attributed my confusion to something less serious.

'I say, Wilfred,' he said laughingly, as he left

me, 'the castle has tumbled down, hasn't it? "Oh, what a fall was there, my countrymen!"'

I made a sickly attempt at a smile, but said nothing, and rushed up-stairs. Lucille to be sacrificed! I would not allow it. I had not met her; but one way was always open to me, and I determined to get my mother's letters, and make myself known at once. I knew I had proofs that were more convincing than any that impostor could produce. But I was not long in my room, before there came an impatient ring at the door-bell. Evidently some one was in a hurry. I listened a few moments, and then quick steps were heard coming up the stairs, and there was a sharp rap at my door. I opened it, and the servant was there, with a note in his hand.

'A man is down-stairs, sir, with a carriage, and he says you must come with him right off. He told me to give you this.'

Bidding the boy tell the man I would come directly, I read the brief note:

'Sir Gerald Wyatt would esteem it a favour if Dr Lansdowne would accompany the bearer to the Towers, where his professional services are requested.'

In a few minutes I was ready, and whirling rapidly thither. I asked the coachman who it was that needed me.

'Miss Lucille, sir. She's awfully shook up, and none of 'em can do anything with her.'

Some nervous affection, I presumed, and I supposed that some exciting circumstances had taken place to throw her in such a state. We were soon at the gates of the Towers; and as I passed hurriedly through the extensive grounds, I noticed that everything showed signs of wealth, lavishly yet tastefully expended. A servant received me, and ushered me into a room, where I saw, leaning against the black marble mantelpiece, a stately-looking old man; and on the opposite side, also leaning in a graceful attitude, one of the handsomest fellows I had ever seen, but with a sinister expression about the finely curved mouth that I did not like. As soon as I had set my eyes upon him, I recognised him; though he did not seem to know me. He was the son of a former valet of Sir Gerald's, before he went to Italy. I had seen the man, and my mother had told me who he was, a great many years since; but I was gifted with a remarkable faculty of remembering a face, after I had seen it once. All this I took in at a glance, before Sir Gerald came forward to meet me.

'Dr Lansdowne, I presume?'

'The same. You sent for me, I believe?'

'I did. Women are such queer creatures. My daughter has taken it into her head to make herself sick on account of a foolish whim.' Then followed an introduction to the handsome, Italian-looking 'cousin,' the real one bowing his head to the impostor.

But I proceeded: 'In order to understand how to treat your daughter, Sir Gerald, I would like to become acquainted with as many of the particulars of her illness as you may judge proper to disclose.'

'Well, it is simply this. Here is Mr Guy Radcliffe, as good a young man as any one need see, whom I intend that Miss Wyatt shall

marry. In confidence, Doctor, I owe it to Guy's mother—who in fact was my cousin—to make some reparation for having neglected her and hers so long. Besides, I know Guy will make as good a husband as Lucille can find.—Isn't that true?' he said, addressing Mr Radcliffe.

'You flatter me too much, Sir Gerald. I certainly intend to make my cousin as happy as is in my power. At any rate, she will do her duty by obeying her father, and I will endeavour to win by kindness the love she now refuses me.'

'Certainly she will obey my wishes, for she has always been an obedient girl. Indeed, she has never yet refused to agree to my proposal in this instance, only expostulated until she saw that I was determined, when she commenced to droop. This evening she was seized with a sort of fainting spell, and has not yet been roused.'

'Then surely there is no time to lose. Please let me see the patient at once, Sir Gerald.' My blood was boiling with rage against that low-bred impostor, who dared to call her his 'cousin,' who dared to offer her his false love!

But we had reached the room of the patient, and all indignant thoughts were expelled before the idea that Lucille lay stretched there, perhaps dying. I went up to the bed, where her sister was kneeling, crying as if her heart would break, and at once directed my attention to the resuscitation of the motionless figure before me. By the use of such restoratives as were in the house, and constant chafing of the thin, white hands that lay so listlessly in my own, I soon brought a faint flush into the pale cheeks and lips, while a heavy sigh told that she was returning to consciousness. In a short time her eyes opened, and rested upon mine. She must have caught my eager look. I turned to her sister and said: 'If you can make her drink a little wine, until the medicine I shall send for arrives, I will consult with your father for a few minutes.' I then left the room to see the baronet, with whom I requested a private interview. He conducted me into his library.

'Sir Gerald,' I began, 'I merely wish to give you my professional advice and opinion. I perceive your daughter's constitution and temperament are of the highest nervous type. She is now broken down by mental suffering, and to prolong the strain might be to imperil life itself. I would beg you, therefore, if you love your daughter, not to mention the subject of her cousin to her until I speak with you again. For this purpose, I shall be glad to have an interview with you to-morrow morning.'

'Certainly, Doctor. As to your instructions, I will promise to obey you; meanwhile, her sister will take the best care of the patient.'

When I got back to my lodgings, and was locked in the secrecy of my room, I gathered together several letters that had passed between my mother and the baronet, her miniature, and also that of Sir Gerald which he had given to his 'cousin Addie,' when both were quite young. The latter was set in sapphires and pearls, and the case was stamped with the Wyatt escutcheon.

### CHAPTER III.

Early the next morning my buggy was standing at the entrance to the Towers, and I was

ushered into the same library that I had left the evening before, and found Sir Gerald waiting to receive me. He greeted me with a smile of pleasure and a hearty English hand-shake. After assuring me of a marked improvement in my interesting patient's condition, he begged me to state the object of my desired interview. I merely placed my little packet in his hand, saying: 'This will explain all, Sir Gerald. But if you wish more conclusive evidence than that which the beloved touch of the dead has hallowed, I can easily furnish it.'

He had opened the bundle, and the sweet face of my mother was the first object upon which his glance rested. 'Addie—my dear little cousin Addie! And my picture too!—the very same I gave to Addie on her seventeenth birthday. In the name of all that is wonderful and incomprehensible, who are you? How did these things come into your possession?'

'Simply from my mother, Sir Gerald, for I am Addie Treherne's only son and child—Wilfred Treherne Radcliffe, otherwise Lansdowne.'

'How is that possible? Here is Guy Radcliffe, who claims the same relationship to Addie Treherne. He certainly brought no proofs; but I, anxious to find my cousin's child, believed all he told me. If you are Addie's son, why are you called Lansdowne, and not Radcliffe?'

'That is a long story,' I said. 'My mother's marriage was one of affection, but not of prosperity; and the circumstances under which my father's career came to an end—and of which I may tell you more at leisure—led us to drop the name of Radcliffe, and adopt that which I bear. It served the double purpose of screening us from the prying eyes of the world, and the scorn of my mother's richer friends.'

For a few minutes the baronet sat in moody silence, as if reflecting on the past, when all at once he said: 'If all this be true—and I do not doubt it—who is this Guy Radcliffe?'

'Do you remember Hugo Rascelli?'

'To be sure I do. He was a valet of mine many years ago.'

'Well, this man is none other than a son of that valet of yours.'

'Now that I think of it, I remember who it is I was trying to discover he resembled. And to think I received the son of a servant I had to discharge for dishonesty, as my heir and the prospective husband of my daughter!'

It was some minutes before the wrath of the baronet spent itself. Presently, however, he began to speak of my mother and his early connections with her. He was thoroughly persuaded that I was the person I represented myself to be, but I was anxious that my motives should not be misunderstood. 'Sir Gerald,' said I, 'I wish you to understand clearly that I have discovered myself to you with no other motive than to benefit your daughter.'

'I do not doubt it,' said the baronet. 'Yet it is my earnest desire that Lucille should marry my prospective heir; and as my cousin Addie's son shall inherit my property, it would add a double weight of gratitude in my obligations to you, should you succeed not only in restoring her to health, but in winning her affections. I must tell her of the changed circumstances, and—'

'Not so fast, Sir Gerald, if you please. If all these changes take place at once, it will be too great a shock for your daughter.' I would advise you to examine this Guy Radcliffe, as he calls himself, and dismiss him privately. You can easily keep the matter quiet. Then tell Lucille that you have been too harsh with her, and you will not compel her to marry a man she does not love. That news, I think, will do more towards raising her up than any medicine I might prescribe for her. As for myself, I hope I have a clearer idea of honour than to present myself as a suitor for a lady's hand under such circumstances. I freely confess that I have seen your daughter before, and by some mystery, unknown even to lovers themselves, have fallen very much in love. But in order to leave my cousin's mind entirely unbiassed, I would like to win her love simply as Dr Wilfred Laisdowne, instead of the long-lost cousin her father wishes her to marry. Does this plan meet with your approval?'

'Entirely, although it is a young man's romantic idea. But meanwhile, I shall say nothing of all this to Lucille.'

I found my patient reclining before the open window of her room, while her sister was sitting on a footstool at her feet. What a beautiful picture the two made! Jessie was the first to notice my entrance; and as she rose, with a slight blush tinging her cheeks, I had to acknowledge that my friend Horace was a happy man in having won the heart of so lovely a creature. And as for her sister—was it my imagination that made me perceive a glad light spring up in those changeful eyes that I had learned to love so well? I certainly thought I detected as much.

As Lucille's disorder was merely a nervous attack that I knew would soon pass over, I had no difficulty in assuring her that exercise was the best medicine I could prescribe, but she must keep perfectly quiet for the remainder of the day.

Days and weeks passed by, and I saw that I could no longer find any professional excuse for repeating my dearly prized visits to the Towers. My anxiety to know whether or not my love was returned, became so great, that I determined to hazard everything by speaking to Sir Gerald, and at once ending my suspense. So again I walked up the broad marble steps, and was ushered into the room where I had always found a kind welcome, and where Sir Gerald was seated.

'Well, my boy, what is it now?'

'I have come, Sir Gerald, to ask you to give me Lucille.'

'Ah! I thought it would come to that. Wilfred, I am only too thankful that at last I am enabled to carry out my long-cherished plan, and call Addie's son my own. If Lucille consents, you need fear no opposition from me. Besides, the impostor has received his *congé*!'

It is no matter what else we conversed about; suffice to say that I left the kind old man's presence with only one thing wanting to complete my happiness. I wandered along the gravelled paths, hoping to find Lucille, yet not knowing exactly where to look for her. I happened to remember a favourite arbour of hers, where I found her fixing up the trailing branches of a rose. I scarcely dared disturb the lovely picture,

and yet I felt she must not be only an image to me, but a loved reality. And so, catching the spirit of England's laureate, whose description of 'Rose, the Gardener's Daughter,' entered my mind, I stepped into the arbour where she was standing, and said:

Ah, one rose,

One rose, but one, by those fair fingers culled,  
Were worth a hundred kisses pressed on lips  
Less exquisite than thine.

She silently handed me the 'one rose'—a pure damask—and then, still clasping those soft, white fingers, I led her to a rustic seat. I never could exactly tell what followed; all that I knew was that I was pouring forth the warmest words of love, and she was listening to me with downcast eyes and blushing face. What did I—did she—say? Has not that 'old, old story' been often told, and as often set 'two fluttering hearts aglow?' 'Are you sure,' said I, after the first burst of rapture, 'that you love me for myself—just as I am?' Suppose your father still clings to his idea of your marrying your cousin, what would you consider your duty then? Would Love settle the conflict between Right and Wrong, Lucille?'

'Oh, don't ask me, Wilfred. When he saw how truly we loved each other, he wouldn't compel me to pass through the same trials from which I have just been released. And it would be a thousand times worse now, since I have loved another.'

'Listen to me, Lucille. I, and not your father's recent visitor, am your English cousin.' And then, seated together, while she wept tears of gladness, we talked of what you, dear reader, already know.

Many Christmas Eves have passed, and many long and happy years have frosted over the brown and golden hair. The voices of children—those of Horace and Jessie, as well as ours—ring from the flowery terraces and shady coverts of Wyatt Towers—our ancestral home in Old England. I am Sir Wilfred Radcliffe now; for the good old man who was so true a friend to me, has long since been gathered to his fathers.

## INDIA IN THE COLD WEATHER.

BY AN ANGLO-INDIAN.

IN our last paper we described some of the phenomena peculiar to the rains in India, and mentioned that they ushered in 'our unequalled cold weather.' The transition is gradual. Perhaps in September we have had a heavy downpour, then a series of showers varying in intensity; after which we have more sunshine, under the influence of which the clouds gradually clear away, and cumulus slowly yields to cirrus. We have now drifted into October, and all know that deliverance is nigh at hand. Punks are still in full swing; but one morning we feel that our exposed feet are chilly during the small-hours, and pull the sheet over them. On rising in the morning, an unmistakable freshness in the air declares that deliverance has arrived; the west wind has set in, and with it the much-longed-for

cold weather. Rejoicingly we go out and inhale the invigorating breeze, and the general congratulatory salutation is, 'Cold weather in at last!'

Now we can fully realise the sweet words of the Preacher—'Rise up, my love, my fair one, and come away. For, lo, the winter is past, the rain is over and gone; the flowers appear on the earth; the time of the singing of birds is come, and the voice of the turtle is heard in our land'—applicable originally to the winter rains of the Holy Land. Now the anxious father, who has been unable to send his wife and children to the Hills, knows that their cheeks, which have paled under confinement and the exhaustion of the hot weather, will soon resume their roses. Now the horticulturist is busy in looking out his seeds and preparing his garden. Now the sportsman furnishes his battery, and charges his cartridges in preparation for the goodly harvest of quail, snipe, sandgrouse, or wildfowl; or casts his bullets for larger game. Now the martinets are nugging up—to use a vulgar expression—the drill-books for brigade parades; and peace manoeuvres loom in the distance. Now the artist arranges his materials; for he will have views unequalled in the world for sharp outlines and clear distances. In the Hills, the eye wanders in delightful amaze along snow-clad peaks, awful in their altitude; distinctly defines the vast glaciers, parents of mighty streams; and then descends to the pine or oak clad mountain sides, all standing out clear and distinct, and apparently half the distance they really are. And now the amateur astronomer burnishes his lenses; for he will have clear skies to rove over, which Greenwich would give worlds to possess. Oh, the joy of release from the tedium of the hot weather and rains, with the certainty that six months of unequalled weather are before you!

In the upper provinces, the punkahs are generally all down by the end of October, and the rooms look quite lofty without them. The staff of punkah coolies is thankfully discharged, and their worrying ways all forgotten; thermantidotes are stowed away in verandas or coach-houses; all doors are thrown wide open, and the house is generally furbished, after the dust and damp of the hot weather and rains. The thrifty housewife takes care that a duty she has performed as often as possible during breaks in the rains, be now thoroughly enforced, and all household linen and clothing are carefully aired, and dried in the now steady sunshine.

All round, as already hinted, there is a general stir on the arrival of the cold weather. Civilians get their camp equipage ready for official touring in their districts; soldiers do the same, for their regiments may be marching in relief. Those who have the opportunity of doing so, seize upon the cold weather for their touring expeditions; and similarly, our Nimrods set out on their campaigns against game of all kinds.

Now, what is the cold weather? What amount of real cold is enjoyed in the 'burning' plains of India? Of course, temperature varies more

or less with latitude, and the farther north you proceed, the greater is the cold. Let us commence with the extreme north-west corner of our possessions, the Peshawur Valley, of which the city is in the same latitude as Cyprus, Crete, and Malta. Now, in that distant dependency, the real hot weather, requiring punkahs, lasts only about three months—that is, from the middle of June to that of September; and in the Valley there are no regular hot winds and no regular rains, so that we may describe the climate as trying for three months, and most enjoyable for nine. From November to March the cold is very severe; the roadside pools are frozen in the former month; and in December and January the water in your earthen jars freezes within doors. This kind of weather attends you generally as far south as Jhelum. At Lahore the cold weather lasts from September well into April. Delhi and Meerut are good medium stations, and there the cold weather sets in about October 15, and up to January the mornings and evenings get colder and colder, and artificial ice is freely formed. The thermometer indoors ranges from forty-five to seventy-five degrees; and fires at night are very acceptable from November to February. Very nearly the same remarks apply to Allahabad, the seat of the North-west Provinces government; but farther south, the cold weather slowly shortens, until you reach Calcutta, where it really extends from mid-November to mid-January, but never in intensity, for water never freezes. The farther south you go, the temperature becomes more equable, and is modulated by the elevation of the southern plateau and the influence of land and sea breezes.

With these general remarks on the temperature of the cold weather in the north-west, let us return to our outdoor enjoyments. And first and foremost is marching.

Those who witnessed the Great Exhibition of 1851, may recollect the camp of tents manufactured at Jubbulpore. Our tents are marvels of comfort and luxury; and none of the trumpery articles turned out as such at home, can approach them. They are of all sizes and patterns, from the gigantic viceregal durbar tent to the humble service tent which sheltered our officers during the Afghan campaigns. The larger tents are each of two so-called 'flies,' one to two feet distant from each other, and each fly is composed of three to four cloths. The fly is the canopy of the tent, and it rests, in the first instance, on the *kanât* or outer wall of the tent, and then is pinned to the ground by ropes and tent-pegs. The inner fly rests similarly on the inner *kanât*; and between the two *kanâts* there is a passage all round the tent, varying from two to three feet in diameter, giving us a tent within a tent, and thus securing warmth in the cold, and protection from heat in the hot weather. Then further large tents are subdivided into rooms by hangings, and outside the outer *kanât*, bathing and dressing tents are attached. When you march in style, you have a double set of tents, one sheltering you during the day, and the other going on over-night, to be ready for you at the next camping-ground.

Well, our tents are all ready, and all our preparations for the march have been made. Our horses of course accompany us, and so do our cows, goats, and sheep. The poultry are not for-

gotten, and have a large bamboo trellis-cage and bullock-cart all to themselves. If camels are available and the country suits, they carry our tents, furniture, and boxes; or else we resort to bullock-carts. In pre-mutiny times, a fakir accompanied each large camp or regiment on the march; and he earned a scanty livelihood by squatting on the roadside about half a mile from the next camping, and announcing its proximity by thumping on his *doog-doogie* (a small drum). That sound used to be very welcome at the end of a long march.

We start early in the morning, after warming our hands at one of the many camp-fires, and either drive, ride, or walk, stopping half-way for a cup of tea or coffee and slice of toast, which we find awaiting us at the roadside. Our guns accompany us; for we may pick up a black-buck, snipe, quail, or wildfowl on the road. Between eight and nine we reach our camp, and find it probably pitched in a spacious mango grove, and everything ready for our arrival.

Tent-life is simply perfect; you are your own master; and as you sit in your tent-door, enjoying your cigar, you feel that all around is your own, that you can move on where you like, enjoy fresh scenes or adventures each day, and, what is more, lay in a large supply of health and strength against the next hot weather.

Here is the outline of a short march, which, for its wealth in magnificent architecture, historic associations, and amble game, is, I fancy, unequalled in India or elsewhere. We start from Agra, after revelling in the glories of the Taj, Fort, Sikandra, and the trans-Jumna ruins, and reach Futehpore-Sikri, the red sandstone, deserted palace-city of Akbar; on to Bhurtpore, famous for its sieges and ultimate capture by Lord Combermere; then to Deig—another historic site—with its marvellous palaces and water-works; passing *en route* Kumbhir, with its strange cannon and famous legend. The Bhurtpore Rajah was assured by the Brahmins that the fort would never fall until Kumbhir, like Birnam Wood, came before it; that is, never. Kumbhir means also 'alligator;' and Bhurtpore with its huge ramparts, laughed at the idea of falling before an alligator; but, unfortunately, Kumbhir was also the native corruption of Combermere; and so, literally, the Kumbhir came before Bhurtpore, and that renowned fortress fell.

On to Goverdhan, sacred to Krishna and his amours with the milkmaids (*Gopis*), where you examine with delight the delicate carvings and strange paintings of the monumental shrines (*Chutris*) of departed Hindu princes; or, if you choose, watch the antics of the sacred monkeys. On to Muttra and Bindra-Ban, washed by the Jumna, two of the most sacred centres of Hinduism, and renowned for its collection of temples, ruined and entire.

Up the right bank of the Jumna to Delhi, a perfect mine of architectural wealth and historic associations. You can wander at will among the ruins of Toghlaabad and the old Delhi; you may crane your neck in looking upwards at the colossal but graceful proportions of the Kootab-Minar, 'the highest pillar in the world,' rising two hundred and thirty-eight feet; or you may try your knees in ascending the three hundred and seventy-nine steps leading to its summit, whence

you command a panorama of ruins which, I fancy, is unique. You may roam through the magnificence of the Emperor Humayoun's tomb, where the last of the Moguls was captured by Hodson in September 1857; or you may stand on the famous Ridge, at the base of the British Futeh-Minar ('tower of victory') and gaze on Delhi itself at your feet, recalling the horrors of the Mutiny, or the sites and scenes of its last bloodstained siege.

Such are some of the attractions of marching; and this tour can be made throughout away from the bustle and rattle of the railway.

I have alluded to our horticultural operations; for these we have peculiar facilities in cheapness of labour, abundance of manure, and irrigation as much as we want. The result is that we can turn out vegetables and flowers which will compete with anything at home; potatoes, one to a dish; gigantic cauliflowers; beet, six inches thick and eight long, soft and succulent; celery heads, two feet high and six inches thick, crisp from top to bottom; lettuces and peas in profusion; strawberries, many of which will yield two bites. In the Queen's Garden at Delhi, the Wingfield Park at Lucknow, and the garden which enshrines the sacred well at Cawnpore, you will see roses equal to any at home; and around Ghazepore, of rose-water notoriety, you can wander at will through acres of Bussorah roses.

As already remarked, the cold weather is the season for sport; and all sorts of game may be attacked and brought to bay, from the lordly tiger to the humble ortolan.

The approach of the season is generally announced by the sudden appearance of the migratory birds, the earliest of which are the water-wagtails. As you are sitting out at night, gazing at the canopy of jewels above, you will often hear the cackling of geese overhead, or the discordant notes of cranes; or, close to your ears, you may hear a rush of either quail or snipe. Now is the time for high and rich feeling to those so disposed. At home, a slice of venison or wild-duck, half a breast of grouse or partridge, a snipe, or a snuff at woodcock, are thought great luxuries or high favours. Out here, you can stuff your full of each or all; and what is more, you can have a whole bustard or a brace of florican all to yourself, for which English epicures would sigh in vain.

The rivers have all run down, and are ready for anglers, and *mahseer* (the Indian salmon), *rahoo*, and the so-called Indian trout, are available.

Now, too, is the time for home sports; cricket, football, racing, all come in for their share of patronage, and are all enjoyed in the sharp bracing air; and while during the hot months walking was perfunctory and grudgingly indulged in, it is now vigorously performed and thoroughly enjoyed.

As soon as the rains are thoroughly over, and the rain-crops—rice, millets, and cucurbitaceæ—off the ground, the peasants begin their winter ploughings and sowings; for now is the time for the cereals and pulse-plants. It is wonderful to see the vast stretches of cultivated land laden with wheat, barley, oats, or *gram*, which last vetch is almost entirely the food of our horses.

Further on in the season, the eye wanders over the golden patches of ripening sugar-cane, sacred

to jackals and wild pig; and to those who relish the cruel sport, pig-sticking becomes the rage.

Let me now allude to an industry peculiar to the cold weather, which, except in small stations distant from the rail, is fast dying out, and that is the manufacture of ice. When I came out in 1853, Calcutta, Madras, and Bombay were wholly dependent on American ice, supplied by the Tudor Ice Company, and retailed at two annas the *ser*; that is, two pounds of ice brought from America were sold in India for threepence! The *mofussil* (up-country) was entirely dependent on artificial ice, which could only be made where the cold weather was really felt; in all other parts we were obliged to cool our drinks with saltpetre and sal-ammoniac; or, during the hot winds, by placing the bottles before the khus-khus tatties, or swinging them in a basket covered with wet straw. By these appliances we could cool our drinks down to sixty-five degrees Fahrenheit; or by carrying on the cooling with fresh supplies of salts, we could even freeze water. But the process was tedious and expensive. Science came to our aid; and sulphuric ether and ammoniac machines came gradually into vogue, and latterly, Carré's wonderful pneumatic machine, which I have seen produce ice in two minutes in a temperature of ninety-five degrees. With these great appliances, block-ice is now available in districts where it could not formerly be had, at from an anna and a half to two annas per *ser*.

To return to the old process—it depended entirely on the production of cold by evaporation, as also on sufficient cold weather and the presence of the dry west wind; the east wind being absolutely fatal to the production of ice.

The essentials for the process are—1. Exposed and treeless ice-fields, which are partitioned off into four to five feet squares, in which two to three inches of straw are laid down. 2. Myriads of flat, porous, earthen saucers six to eight inches in diameter. 3. An unlimited supply of water. 4. An army of coolies and water-carriers. 5. The ice-pit. This, the most important adjunct in the process, is very carefully constructed; a great pit is dug, and in it rests a huge timber cone, the space between it and the sides of the pit being rammed with charcoal, chaff, or straw, as non-conductors of heat; the cone itself is lined thickly with coarse felt or blankets, and then a layer of matting; over all, a straw hut, with very thick roof and walls and a very small entrance, is constructed.

Now for the process. Whenever the outside thermometer reads forty-two degrees, then ice can be manufactured by evaporation. Half an inch of water is poured overnight into the saucers by *bheesties* (water-carriers); then at two A.M., a great drum is beaten at the pit to summon the coolies, who assemble in hundreds, each armed with a scoop, with which the ice is skilfully turned out of the saucer into an attendant vessel, and well rammed into it. When full, it is taken to the pit, emptied there, and again rammed down. Thus all the ice has the chance of consolidating by congelation; and in a good season, thousands of pounds' weight of ice may be stored, according to pit-room available.

Thus I have endeavoured to portray the main features of our Indian cold weather; and if this series of papers in any way removes the mis-

apprehensions formed regarding this country, my object in penning them will be amply fulfilled, and it will be allowed that 'India is not so black as it is painted.'

### A SHEEP-EATING PARROT.

A SINGULAR bird has recently been added to the collection in the Zoological Gardens, London. This is none other than a carnivorous parrot, whose love of animal flesh manifests itself in a very decided predilection for mutton. There are two things which to the naturalist are remarkable in connection with this bird. First, it is, in respect of this flesh-eating propensity, an exception to the whole family of parrots, which are frugivorous, living on fruits, seeds, leaves, buds, and the like; and second, this carnivorous taste is not a natural but an acquired possession, the species of parrot in question having been till a few years since frugivorous, like others of its family.

This curious bird is the Kea (*Nestor notabilis*) or Mountain Parrot, and comes from New Zealand. The general colour of its plumage is green; its length from point of bill to extremity of tail, is twenty-one inches; its bill is about two inches long, the upper mandible being curved, and very strong. It inhabits the higher wooded glens and recesses of the mountainous districts of New Zealand, and, like the owl, is generally nocturnal in its habits. The Kea was first made known to science in 1856. In the time of Maori rule, the bird was as innocent and harmless in its habits, as respects its food, as any others of the parrot family; and it was not till the higher tracts of country were utilised by the early settlers as runs for sheep, that the Kea was tempted to desert its fruit-eating habits, and to join the destructive army of the carnivora.

About 1868, it was noticed at the sheep-shearing season on the upland runs that many sheep were suffering from sores or scabs, more or less recent, on the back, immediately in front of the hips. Curiously enough, it was observed that in all the animals so injured the wound was in precisely the same place in each—fairly above the kidneys. In some cases (says Mr Potts, who has contributed an article to the *Zoologist* on the subject), the part affected had a hard dry scab, or merely a patch of wool stripped off; others showed a severe wound, in some instances so deep that the entrails protruded. The animals so injured were invariably those that were in the best condition; and many discussions ensued as to what could be the cause of this singular state of things. At last a shepherd gave it as his opinion that the injury was inflicted by a kind of parrot, rather a tame sort of bird, that was to be met with in the higher ranges; but the shepherd's opinion was only laughed at. Yet the shepherd, after all, was found to be right. In connection with the stations on sheep-runs in New Zealand, there is a meat-gallows, where the carcasses of sheep killed for food are kept; and it was observed by the shepherds that the Keas were in the habit of visiting the gallows and breaking off bits of mutton-fat with their strong beaks. Soon afterwards, one or more hands actually saw a parrot on the back of a sheep plucking and tearing the wool and flesh on a precisely similar spot to that where so many had been found to be fatally wounded.

There was no doubt about the Keas being the offenders, and means were at once taken to have their numbers reduced. Since then, a mortal enmity has existed against them on the part of the shepherds; and justly so, as it is found that from three to five per cent. of every flock is so wounded or killed. In some individual instances, the ratio of destruction has been much higher. On one station on the Matatapu, out of a flock of twenty Lincoln rams, nineteen were within one month killed by these parrots. On another run, a flock of three hundred and ten strong young wethers were, within a period of five months, so seriously injured by the Keas, that at the end of that time only one hundred and five remained alive. In consequence of this destruction, men were engaged to kill the bird at a shilling a head; and these men, taking advantage of its nocturnal habits, now range the mountains at night, lighting fires to attract their game. In the daytime, they rest and prepare the skins for sale. But the Kea, with the cleverness and cunning of its tribe, has grown very shy and wary, and knows very well, when it sees a man carrying a gun, what he is likely to do with it.

Mr Potts gives a 'striking account of the cruelty and rapacity of the Keas in the prosecution of their horrible taste for sheep-fat, the part especially liked by them being the fat that surrounds the kidneys. With this view, they do not hesitate to tear open the animal's flesh till they arrive at these organs, after tearing out the fat of which, they leave the poor animal to linger on or die in excruciating agony. 'Sheep,' says Mr Potts, 'whilst being got out of snow-drifts, are often mortally hurt by the attacks of Keas; especially are the birds prone to molest those carrying double fleeces, as though they knew how firm a foothold they could maintain with their grip. When one of these sheep, temporarily exhausted with its exertions in toiling through deep snow under the burden of two years' growth of wool, breaks off from the mob and leaves the track, desperately floundering into deeper snow-wreaths, a flock of parrots, ever watchful as they hover round, soon perceive their opportunity for mischief: they alight close to the spot where the sheep, unconscious of approaching danger, stands gazing fixedly in a state of helpless stupidity; gradually hopping or moving towards the victim with some show of caution, one of the Keas at last settles on the back of the sheep, which, terrified at the strange visitor that thus besets it, bounds away; the bird now rises only to alight again on the same place, and clutching into the wool with its sharp claws, retains its hold more firmly and tenaciously. In vain the tortured animal in the direst agony seeks to rid itself of its cruel persecutor, that boldly keeps its vantage; after running and struggling some distance, its efforts to escape become feebler; it is at length so hard pressed that in a few minutes it yields passively to the tearing and searching beak of the Kea.'

These repulsive flesh-devouring propensities may have been acquired through the bird being forced, in severe winters, to approach the stations in hopes of finding food, and there feeding on the flesh in the meat-gallows, and thus gradually forming a carnivorous appetite of such strength, that its former frugivorous tastes are entirely

destroyed, and flesh now forms its sole food. The Kea in the Zoological Gardens was struck down while it was in the act of attacking a sheep; but the man did not succeed in capturing it till it had torn his clothes in many places and severely lacerated his hands. Its food consists mainly of mutton, raw; it does not care for cooked meat, but will take it if very hungry. Occasionally it will take beef, and is fond of pork. But its vegetarian tastes seem almost completely eradicated, for it will not touch bread, though it likes the seed of sow-thistle. It is altogether a remarkable and curious bird.

#### JOINT-STOCK ENTERPRISE.

In an article entitled 'Joint-Stock Enterprise,' in the *Journal* of October 1, 1881, it was said, that among the forty-eight Companies contributing no information to the official Return, and therefore, apparently to be included in the category of Companies having no capital, and no shareholders save the original signers of the memorandum of association, the Eagle Insurance Company is set down for half a million. The writer of the paper in question has to acknowledge this to be a serious misstatement, arising out of a simple clerical error of omission, in transcribing for the press, whereby the 'Eagle Marine Insurance Company,' which seems to have been floated only to founder, was described as the 'Eagle Insurance Company,' and great injustice done to the latter, which is a sound and solvent institution of more than seventy years' standing. For this purely accidental blunder, we have to express our deep regret; but would take the opportunity of suggesting that something might be done to protect titles, like trade-marks, from imitation. As things are, it seems open to any mushroom Company to assume a designation so nearly resembling that borne by one of well-earned repute, as to lead the public to suppose that it is the same concern, or an offshoot of it, and to be trusted accordingly.

#### CHRISTMAS.

HARK, hark! Again the echoing Christmas bells,  
Mellow and clear upon the frosty air,  
Ring out with silver-toned and sweet refrain,  
The blessed story, old yet ever new,  
That angels once to lowly shepherds told,  
The tale of 'Peace on Earth, Good-will to Men!'

In twice ten thousand happy homes,  
The holly-bough gleams bright upon the wall;  
And cheery groups around the well-piled fire  
Gather, in loving converse: lisping sounds,  
The prate of joyous Childhood; whilst Old Age  
Itself again made young by sympathy,  
Looks on in bland approval.

Oh, how sweet  
The joyous time of Charity and Peace  
And Love, to man God-given! when all feuds  
Awhile are healed—the Sword is thrown away,  
The Olive branch is tendered; and Good-will,  
With care for all our poorer brothers' needs,  
Opens our hearts, and makes the Christmas Time  
The happiest of all the circling Year.

## THE NEW THEORY OF TIDAL EVOLUTION.

THERE are few persons who have not been occasionally at the seaside, and watched the tides. Every twelve hours the water of the ocean advances towards the shore with slow and measured pulsations; and no sooner does it approach high-water mark, than it slackens, stops, and then begins to recede in the same gradual and regular manner. From day to day, and year to year, this constant ebb and flow is going on, till the 'tide' has become, equally with 'time,' the symbol of uncontrollable and unhesitating movement. Most people also know that these tides are in some way or other dependent on the moon—that they are in some way regulated by the moon's relation to the earth. Yet, although the general principle of this theory is obvious and determined, various questions arising out of it have continued to puzzle alike the astronomer and the physicist; and the investigation of these questions has led to what is known as the Theory of Tidal Evolution, the discoverer of which is Mr G. H. Darwin, Fellow of Trinity College, Cambridge, and eldest son of Charles Darwin, whose name may be said to stand first in the ranks of science in the nineteenth century.

For the materials by means of which we propose to explain this new and wonderful discovery to our readers, we are indebted to a lecture delivered in October last at the Midland Institute, Birmingham, by Robert J. Ball, Andrews Professor of Astronomy in the University of Dublin, and Royal Astronomer of Ireland. Professor Ball, like his contemporaries Professors Huxley and Tyndall, possesses in a marked degree that valuable combination of literary skill and scientific precision which renders their expositions of great principles as luminous and interesting to the non-scientific as to the scientific reader.

In dealing with a subject of this kind, time must be measured neither by centuries nor millenniums. Thousands of years are not sufficient to give expression to the dates required, nor tens

of thousands, nor hundreds of thousands; the course of geological time is to be reckoned by millions of years. Retrospectively, therefore, we must pass over a period of time which cannot be less than fifty millions of years. About that time it is supposed the chief controlling power in the tidal movements of our ocean came into existence—the earth assumed 'the dignity of maternity,' and its first-born was the moon. 'At the time of the moon's birth, the earth was not as we see it now, clothed with vegetation and teeming with animal life. It was a huge inorganic mass, too hot for life, perhaps hot enough to be soft or viscid, if not actually molten. The offspring was what might be expected from such a parent. It also was a rude inorganic mass. Time has wrought wondrous changes in both parent and child. Time has transformed the earth into an abode of organic life. It has transformed the earth's offspring into our silvery moon.'

But how, it may be asked, was this birth brought about? The answer, while rigidly based on legitimate scientific induction, is poetical enough to be worthy of the finest imaginations amongst the poets of ancient Greece or Rome. Fifty million years ago the earth, as already remarked, was not as we see it now. At the critical epoch of the moon's birth, the length of the day was only a very few hours—something more than two and less than four. If we call it three hours, Professor Ball thinks we shall not be far from the truth. The mathematician finds that it could not have been—never at any time could have been—much less than three hours; because, if the rotation of the earth on its axis exceeded a certain speed, the equatorial portions of the globe could no longer cling together. 'It can be shown that the rotation of the earth when on the point of rupture corresponds to a length of the day somewhere about the critical value of three hours; it is therefore impossible for us to suppose a day much shorter.' Hence, while the earth was rotating at this enormous speed—namely, once in three hours instead of once in twenty-four—it must have been strongly

predisposed to rupture; and a cause tending to precipitate such a rupture, or throwing-off, was then ready to hand. This was the power of attraction by which the sun, as well as the moon, produces tides in the earth, though these solar tides are very small as compared with the lunar ones. The sun, however, does exercise such a power; and there being at that time no moon, and hence no lunar tides, the throbs, or pulsations, or bulgings, which the solar influence produced in the soft or molten body of the earth—for tides do not require oceans, or even water, for their operation—was not unlikely the occasion by which the moon was fractured off from the earth and assumed the dignity of an independent body. It was thus the moon was born; and it is at this point that its life-history begins.

The fragment in this way torn off from the earth, being a soft and yielding mass like that of the earth itself, would not long retain the ragged corners and irregular shape which it probably at the first had. The mutual attraction of its particles would draw the mass together, till it gradually assumed the beautiful globular form which we now see. 'By the same gentle ministrations the wound of the earth would soon be healed. In the lapse of time the earth would become as whole as ever, and at last it would not retain even a scar to testify to the mighty catastrophe.'

But though the earth and the moon thus became separate existences, they did not fly to a great distance apart. The child continued metaphorically to cling to its mother. At the commencement of this epoch the two globes were quite close; they were revolving rapidly, and the moon was constantly over the same locality on the primeval earth—no doubt somewhere near the equator. Around the primeval earth the moon revolved in three hours; the earth also revolved in three hours; and thus their relative positions remained unchanged. They were for the time in a state of unstable equilibrium. But this could not last. 'Either the moon must fall back again on the earth and be reabsorbed into its mass, or the moon must commence to move away from the earth. Which of the two courses was the moon to take? The case is analogous to that of a needle balanced on its point. The needle must fall some way, but what is to decide whether it shall fall to the right or to the left? We do not know what decided the moon, but what the decision was is perfectly plain. The fact that the moon exists shows that it did not return to the earth, but that the moon adopted the other course, and commenced its outward journey.'

It is upon this fact, that the moon is constantly though slowly receding from the earth, that all this superstructure of reasonable inference and speculation is based. Once ascertain the fact of this recession and its rate of movement, and the rest is simply a matter of calculation. As is well known, any body moving in a circle has a constant tendency to proceed in a straight line, or fly off at a tangent, unless withheld by a force pulling it towards its centre; and this constant tendency to fly off had, in the case

of the moon, the effect of gradually enlarging its orbit—that is, the path, so to speak, along which it travels round the earth. Hence, after its separate existence had been effected, the moon began to remove slowly but regularly to a greater distance from the earth. In the course of this movement two things happened. The first was, that the moon as it receded, and kept continually enlarging its orbit, took more and more time to accomplish its circuit round the earth, thus bringing the original equality of revolution between the two bodies to an end. The second result was, that the effect of the moon's attraction on the earth, as exemplified in the tidal movements of the latter, had the effect of retarding the rotation of the earth; just as a piece of wood held firmly against a revolving wheel will in course of time bring it to a standstill, if fresh energy be not infused into the wheel to replace that which is withdrawn by the friction of the piece of wood. In other words, the tides are caused by the moon; the work done by the tides withdraws energy from the earth; and the energy thus extracted is never restored. The immediate consequence, then, of this lunar friction or withdrawal of energy, was to retard the progress of the earth, whereby the rate of its rotation on its axis is constantly diminishing. We thus arrive at the first great result of lunar interference: '*The tides are increasing the length of the day.*'

From this simple fact the great theory of tidal evolution is deduced. 'At present no doubt the effect of the tides in changing the length of the day is very small. A day now is not appreciably longer than a day a hundred years ago. Even in a thousand years the change in the length of the day is only a fraction of a second. But the importance arises from the fact that the change, slow though it is, lies always in one direction. The day is continually increasing. In millions of years the accumulated effect becomes not only appreciable but even of startling magnitude.' And the change in the length of the day must involve a corresponding change in the motion of the moon. 'If the moon acts on the earth and retards the rotation of the earth, so, conversely, does the earth react upon the moon. The earth is tormented by the moon, so it strives to drive away its persecutor. At present the moon revolves round the earth at a distance of about two hundred and forty thousand miles. The reaction of the earth tends to increase that distance, and to force the moon to revolve in an orbit which is continually getting larger and larger.'

Thus, then, as the moon receded, the period which it required for its journey round the earth increased also, till that period, which initially was but three hours, has increased to our present month of six hundred and fifty-six hours. At the same time that the earth's rotation on its axis is getting slower, so is that of the moon, but the retardation of the moon is much greater than that of the earth.

The moon continuing to recede further and further from the time of its first revolution about the earth, 'at length,' continues Professor Ball, 'a noticeable epoch was reached, to which I must call attention. At that epoch the moon was so far out, that its revolution took twenty-nine times as long as the rotation of the earth. The month

was then twenty-nine times the day. The duration of the day was less than the present twenty-four hours, but I do not believe it was very much less. The time we are speaking of is not very remote, perhaps only a very few million years ago. The month was then in the zenith of its glory. The month was never twenty-nine times as long as the day, before. It has never been twenty-nine times as long as the day, since. It will never be twenty-nine times as long as the day, again.'

This maximum length of month could not long, in the nature of things, continue; the ratio of the day to the month was still undergoing a change. As the velocity of the earth abated, and the length of the day was correspondingly increased, it by-and-by came to revolve only twenty-eight instead of twenty-nine times during one revolution of the moon around it; till now, in our time, it only makes twenty-seven rotations in one revolution of the moon. 'This has remained sensibly true for thousands of years, and no doubt will remain sensibly true for thousands of years to come; but it will not remain true indefinitely. Wondrous as are the changes which have occurred in times past, not less wondrous are the changes which are to occur. Further and further will the moon retreat, and more and more slowly will the earth revolve. In the dim future, many millions of years distant, the final stage will be approached. As this stage draws nigh, the rotation of the earth will again approach to equality with the revolution of the moon. From the present month of twenty-seven days, we shall pass to a month of twenty-six days, of twenty-five days, and so on until eventually we shall reach a month of two days, and lastly a month of one day. When this state has been attained, the earth will constantly turn the same region towards the moon.

'Here you see that the first state and the last state of the earth-moon history are in one sense identical. In each case the same face of the earth is constantly directed towards the moon. In another way, how different are the first stage and the last. At the beginning the day and the month were both equal, and they were each *three hours*. At the end the day and the month will be again equal, but they will each be *fourteen hundred hours*. The moon will then go round the earth in fourteen hundred hours, while the earth will rotate on its axis in the same time. In other words, the day is destined in the very remote future to become as long as fifty-seven of our days. This epoch will assuredly come if the universe lasts long enough. When it has come it will endure for countless ages. It would endure for ever if the earth and moon could be isolated from all external interference.'

There is only one way, as the Professor humorously remarks, by which this otherwise inevitable result can be avoided. It is by anchoring the moon, and keeping it from going out. 'If you can do this, and if you can also provide a brake by which the speed of the moon can be controlled, then you will be able for ever to revel in the enjoyment of a twenty-four-hour day. Should this engineering feat never be accomplished, then we have only the fourteen-hundred-hour day to look forward to.'

Stated in this abrupt way, the outlook is such as to take us by surprise. But, the Professor reminds us, there is nothing untoward in the prospect when

we take natural selection as our comforter. By natural selection man has become exactly harmonised with his present environment; and as the day lengthens, so will man's nature gradually change too, without any hardship or inconvenience. It seems no hardship that our children should have a day of one second and twenty-four hours instead of twenty-four hours; our grandchildren a day a second longer than the day of our children; our great-grandchildren a second longer still, and so on continually. No one except the astronomers would be able to detect the change, and daily life would be unaltered. Yet, carry on this process for a *hundred and fifty million years*, and we shall find that the whole change of the day from twenty-four hours to fourteen hundred hours has been accomplished. 'The actual rate of change is much less than this, and is at present so small that astronomers can hardly even detect it.' When, however, this remote period, with its day and night of seven hundred hours each, is reached, as reached it will be, the solar tides will again intervene, as we found they intervened previous to the birth of the moon. They will have little effect upon the moon; it will revolve as before; but they will begin to retard the progress of the earth still further. Instead of a period of fourteen hundred hours, the earth will have a still longer day, so that, finally, the moon will revolve more rapidly around the earth than the earth will rotate on its axis.

All these surprising and momentous changes in the future will be due to tidal influences. But let us revert for a little to the past, and see what the effect of these tidal influences has been during the millions of years of geological time.

Ramsay, Lyell, and their school of geologists have been content to believe that the external agencies which are at present gradually changing and modifying the earth's surface, are sufficient, if they be given time enough, to account for all the changes that have taken place in the earth's surface or crust during the geological periods of the past. But the mathematicians and physicists would not give them time enough, and they ordered the geologists to 'hurry up their phenomena.' But here, in this latest theory of tidal evolution, we have a new and stupendous power introduced, of which the geologist has hitherto had no conception. The height and force of the tides at the present time, varying from a few inches in some localities to sixty or seventy feet in others, are as nothing compared with what they must have been when the moon was one-fourth or one-sixth nearer the earth than it is now. The moon is at present two hundred and forty thousand miles distant from the earth; but there was a time when it was only forty thousand miles away. The efficiency of the moon in producing tides varies inversely as the cube of its distance. Taking the low average of three feet as the height of our tides all over the globe, under our two-hundred-and-forty-thousand-mile moon, Professor Ball calculates rightly that the forty-thousand-mile moon, being at a distance of only one-sixth of our present moon, would have its tidal influence increased two hundred and sixteen times. That is, instead of the three-foot rise and three-foot fall of our present tides, we would have these ancient tides rising and falling a height of *six hundred and forty-eight feet*. Take into consideration with this, that the

earth at that time made a complete rotation on its axis in perhaps from four to six hours, and we have the movement of this tremendous mass of water rushing to and fro upon the surface of the earth, grinding down its rocks and scooping out its valleys, with a velocity and a power of which we can have but the very faintest conception.

'These mighty tides,' says Professor Ball, 'are the gift which astronomers have now made to the working machinery of the geologist. They constitute an engine of terrific power to aid in the great work of geology. What would the puny efforts of water in other ways accomplish, when compared with these majestic tides and the great currents they produce? With this new and stupendous tidal grinding-engine, the geologists can get through their work in a reasonable period of time, and the geologists and the mathematicians may be reconciled.'

In all the difficulties that have hitherto surrounded the geologist in relation to the immense marine deposits of the past, and which now form the principal rocks in the earth's crust, this new theory of tidal evolution may operate as a most important factor, introducing as it does a denuding agent of tremendous power, before which all similar existing agencies dwindle down into mere nothingness. Should the doctrine be found to be as irrefragable as Professor Ball considers it to be, the nineteenth century will have added to its great scientific achievement of Natural Selection the equally wonderful theory of Tidal Evolution.

## THE COUNTER-SYNDICATE.

### CHAPTER IV.—THE RECKONING-DAY.

THE departure of Mr Quick roused the partners from the crushing feebleness his presence and words had caused. Mr Naylum was the first to show symptoms of returning energy. He rose to his feet, then walked to the window looking into the street. The sight of busy people hurrying along: the sharp rattle of a cab dashing past; and the occasional rumble of heavy railway-vans passing the end of the street, gradually brought his mind nearer to its ordinary focus. Mr Quick ceased to occupy the whole field of his mental vision, as these external objects and sounds resumed authority over Mr Naylum's consciousness. That quiet tyranny of the commonplace, to which we are subject for the greater part of our lives, gives a steadiness to excited brains beyond any other anodyne. Mr Naylum grew calm as the familiars of his daily surroundings greeted him in their wonted guise once more. Alarm began to subside, and a revulsion of feeling soon followed.

This grew apace, and at length he was able to unlock the cupboard, where he kept a bottle of choice sherry, which he took with his mid-day sandwich. He drank a couple of glasses with eagerness. Soon the rebound came; his face assumed something of its usual ruddiness; his hand no longer trembled; his head grew erect.

'Come, Fox,' he said, filling a glass and pre-

sending it to his senior, 'we must not give up in this way.'

Mr Fox was fifteen years older than the junior partner, and was of much feebler physique. He would need a considerable interval to reach his ordinary mental altitude. He drank the wine, however, as did Mr Smiles also; and in half an hour, business acquaintances would not have detected any striking change in the behaviour or demeanour of the partners.

After a desultory talk, interrupted by spasms of recurring fear, the perilous situation of things was discussed with as much coolness as rackled nerves allowed. The native hardihood of Mr Naylum and his predominating animal force began to control his less resolute friends. A fourth glass of sherry heated his blood to its usual choleric irritability, and he felt equal to fighting Quick and the rest of his enemies to the death.

'Are we going to let these fellows do as they please with us?' he demanded, breaking in upon a timorous objection by Mr Fox. 'How do we know that Quick is not as great a liar as he is a traitor? He may have been imposing a heap of fictions upon us after all. Granted that Grossechnabel has cut us adrift, granted Sharpsinn and Goldmacher have betrayed us, how do we know that everything else is as black as Quick paints it? I am for fighting to the last.'

'I do not think that Quick is a liar,' said Mr Fox after a short reflection. 'He is in too strong a position to need the aid of falsehoods, and his nature is hard and stubborn. Weak, shifty, unfortunate men tell lies; bold men can get on without them. No; Quick has told the truth, I fear.'

'Whatever he has told,' interposed Mr Smiles decisively, 'we must not forget that he is our proclaimed adversary. Naylum is right; we must defend ourselves without delay.'

'Well, what do you propose, Naylum?' asked Mr Fox with fretful submissiveness.

'What do I propose? This. I shall go first to Grossechnabel, and learn, as far as I can, the extent of his committal to the "bulls."—You, Smiles, must go to Paris as soon as possible, and learn on the spot what is the worst we have to expect from De Predateur.—You, Fox, must hunt up every vestige of influence we possess in the City, and stick at nothing that promises help. The rise in silk, on which such great results depend, is most encouraging. If we can hold on for a fortnight, we may pull through, even if all be as bad as Quick asserts.—After seeing Grossechnabel, I shall start for Hamburg, to investigate the doings of Sharpsinn and Co. with my own eyes. Let us remember those people have other commissions of ours in hand; and if they have checkmated us in this cursed coffee business, they will not hesitate to damage us further. Our only chance of safety lies in action, swift, deliberate, courageous action. If we succeed, I will spend twenty thousand to punish that scoundrel Quick. If I ever get him into my power, I will crush him down again into the mud from which we raised him, and beyond hope of rising again.—Come Fox,' he cried vehemently,

'for heaven's sake, pluck up some spirit! Be a man! All is not lost yet, because a number of wolfish traitors have joined to compass our ruin. Are you going to be dragged down into the abominations of poverty and disgrace, without striking a blow at your enemies? Come! Do not let us submit like cowards.'

A gleam of bright confidence overspread Mr Smiles's face during his friend's fervid harangue, and it mounted to a commendatory cry at the end.

'Well done, Naylum! You are a faithful partner, in bad luck as in good.—Now, Fox, my very dear friend and fellow-sufferer, pitch away your fears, and do your share to retrieve the *faux pas* we have made together. I shall do as Naylum suggests; and shall not leave Paris until I have bottomed the mystery of this defection of our old agents. I will wire you as things develop. Of course I shall use our private code, though, by the way, I must make some alterations in it, now that Quick is against us. However, you will have the key. In the midst of such treason as now prevails, I can trust nobody but ourselves. That German Steinhertz is a new figure in London finance; but I shall learn from old Haquin of the Rue Freydean all about him; if he is known in Paris.—Now, Fox, my dear fellow, cheer up. You are indispensable for the general success. Here you will remain in the citadel, when Naylum and I are fighting outside; if you fail to defend our common interests, all our work will be fruitless. *Allons!*'

A wintry smile was the only response. But noting that Naylum was going to explode, and that Smiles, usually bland under all provocations, was red with passion, Mr Fox, by a great effort exclaimed: 'Be sure I shall not be wanting in what is my duty. I need no urging to look after the great stake I have in this house.'

'But, Fox, at anyrate pray put on a different look. If you go out with that expression, everybody will read disaster in your face.' Mr Smiles again relapsed into his winning style. 'What we want now is to inspire confidence into friends, and dread into foes. Bold looks and high-toned voices are simply worth thousands to us at this moment. Think only of the winning side; for we may win still. And take another glass of wine.'

'Yes, take another glass, Fox,' added Naylum eagerly; 'you know I only drink the best. I find a pint of this Amontillado the finest tonic in the world. And for the time this bothering trouble lasts, do justice to your own excellent port. Likewise eat more than you usually do. In short, charge the digestive magazine with all the combustibles and ordnance needed for the battle now commencing; a battle for dear life, for fortune, for revenge! Revenge! Fox, think of that. Sweet revenge upon those who are glorying in your expected downfall.—Here, Smiles; take another glass yourself; and I will drink a last to the eternal confusion of Quick, Grosschnabel, and all other scoundrels who are arrayed against the house of Fox, Smiles, and Naylum.'

'Bravo! Naylum,' cried Smiles, slapping his partner's broad back. 'You are a rare yoke-fellow. No, no; we are not children, terrified with any one who cries "Boo!" We have missed fire before to-day, Fox. Do you forget that Bombay hemp

affair, how ugly it was? But the rise in Cape-wool squared that difficulty, big as it was, and left us a cheerful margin. Again, I say, almost solemnly, Fox; and here Mr Smiles became singularly grave—somehow early sherry, to which he was not accustomed, seemed to have an abrupt depressing influence.—'I say solemnly, Fox, look cheerful and take a hopeful view. It is madness to meet trouble half way.'

The appeal was not without effect. Mr Fox got up and straightened his relaxed limbs; then he rubbed his chilled fingers before the fading embers of the fire, and sat down again in apparent perfect composure. But his wandering eyes and the indeterminate movement of his hands showed that anxiety was only masked, and that his sympathy was an uncertain emotion.

Both the others looked keenly at him; then furtively at each other, knitting their brows.

'Why, it's twelve o'clock!' exclaimed Mr Naylum, looking at his watch. 'I must catch Grosschnabel before he goes to his bank meeting.—Smiles, just come to my room for a minute. I have some French money; you may as well make use of it.'

The two left Mr Fox to himself.

When they were alone, Naylum said in a hoarse whisper: 'Fox is played out. I dare not trust him.'

'Oh! he will be all right after a while,' returned Smiles, full of confidence once more; 'he always was nervous, you know, and he gets worse as he grows older, I think. Besides, we must trust him. He cannot do what we are going to undertake. I'll tell you what, Naylum, we want some young blood brought into the concern. If that wretch Quick had not been so uppish and conceited, he would have been invaluable; but it's always the way with young men nowadays. And what are we going to do with his department? That is another perplexity. Who can take up his work? Naylum, we are hemmed in with difficulties.'

'Pooh!' ejaculated the other disdainfully; 'we must deal with them in detail. We cannot do everything at once. Don't go on like Fox; we must pull together whatever happens. Things must hobble on as best they can for the next few days. I'm not afraid of Fox. He is like a whipped child. If we fail, he will be the cause.' He stood staring at the fire for a moment, then added gloomily: 'Smiles, we do want a young, resolute brain to help us. Yet, do you know, I would rather lose all, than have taken Quick into the firm. I always disliked him, and Fox knows it.' Harassed by fiercely opposing emotions, Messrs Smiles and Naylum went their several ways.

Meanwhile, the senior partner sat rigidly still, resting his head upon his hands and staring at the opposite wall with the remote gaze of complete abstraction. He needed quiet, perfect quiet to gather together thoughts scattered by the scenes of this fateful morning. Facts and feelings told him that the decisive crisis of his life was now at hand. Stupendous changes were coming, which his short remnant of life could not appreciably mitigate. When a man is sixty-five, he is, as a rule, too far advanced to make a new start. Young men, and those like Naylum, in the summer of their strength, might rise from the stormy waters

and struggle to shore; but he felt no power to do so. Besides, Mr Fox had not the fiery aggressiveness of his junior partner; nor had he the plastic susceptibilities of Smiles. He had much self-reliance in extremity; he was sternly selfish too, when self was pitted against the world. Although partially stunned, and thrilled by returns of prostrating terror, Mr Quick's most incisive words afforded a growing *point d'appui* round which he could frame a policy to meet his emergency. The firm was in direct jeopardy; the supreme question must be personal safety. He was glad Naylum had decided in that way, and that both partners would be absent for a few days. He could use that interval to secure some of his private resources from harm. The idea of allowing his wife and daughters to be stripped of everything was not to be endured. If an utter smash came, well, outsiders must accept a share of its consequences. Self-preservation was the first law of nature.

A smile crept over his weary face as he saw, in his mind's eye, Naylum rushing impetuously to Hamburg. What could he effect there? Would Sharfmann and Geldmacher become loyal once more under the reproaches and examinations of a stricken man? And what could Smiles extort from such egoistic vultures as De Prelateur and Toutœil? Bah! why could his partners not understand that they were irremediably deceived by these astute foreigners, without still more galling evidence! But, let them go. A Titanic blow had fallen upon the house of Fox, Smiles, and Naylum, destroying the bonds which had caused its coherence. The master-fact of the position was—that the firm was practically in dissolution! Whether his associates knew it or not, each now must go upon an *individual* path.

If age had robbed Mr Fox of iron nerves, and if Nature had denied him the swift resilience with which Mr Naylum was gifted, time and temperament now combined to give him the advantage of logical behaviour in the hour of peril. As he grew calmer, he could look beyond the immediate circle of tempestuous personal egoisms into that far more determinate circle of other people's egoisms. The general circumstances of the financial world rose out of the mists with which terror had enwrapped them, the old habit of discounting external probabilities returned. All great speculators are endowed with the far-reaching imagination which enables them to enter into the expectations of others. Mr Fox had this faculty in a larger measure than his partners. He now had a glimpse of the part the world would play when money-markets were quivering with apprehension. This gave new steadiness to his purpose, gradually becoming consistent amid all perturbations and relapses into impotency. Experience had taught him that in the days of mercantile agony the claims of friendship went to the winds; as well beg the stony walls of the Bank to transmute themselves into gold, as implore assistance from suspicious capitalists. If there is a region on earth where *doubt* is but another name for *death*, it is in the haunts of business during a commercial crisis. No form of fear is so terrifically selfish as that of Croesus trembling for his gold. To save it from harm, he recked not of kindred, of friends, of promises sacred as the grave.

Mr Fox saw himself and partners caught up in the onrushing whirlwind, and hurled into mercantile oblivion, despite all struggles. He could not think longer, but got up hastily and went out.

Mr Naylum's advice to eat and drink copiously of the best, was an impossible regimen for his senior, who was abstemious by nature, and at the present moment quite averse to piquante food. Still, he felt in need of something to stay the faintness coming over him, and went to the old-fashioned hotel he frequented. After a light meal of coffee and biscuits, he proceeded to the nearest cab-stand, and choosing a vehicle with a sprightly horse, he bade the driver take him to Westminster Hall. He wanted to be in motion, swift, distracting, but familiar motion. It took him out of himself, and gave his brain a rest from its own crashings. Then the air began to revive him, and the glare of the shops to interest him, as though he had never seen such things before. He was in a kind of waking sleep when the cab stopped, and he stared in wonderment at Palace Yard. Only for an instant; bidding the man await his return, he entered Westminster Hall as though on urgent business. But he had none whatever. He had sought it for quiet; in the hazard of defining the goal of his drive, Westminster had cropped up, as fifty other places might have done. Parliament was not sitting, and only a few lawyers and members of the public were walking about. Poor Fox paced the Hall automatically for half an hour, and by degrees a gentle languor took the place of the previous disquiet. He went back to the cab, and drove in a wide circuit, round the Park and *via* Oxford Street, back to the City.

At five o'clock he was sitting at his desk. Naylum had gone on his way to Hamburg, and Smiles had left to prepare for his journey. At length his mind had settled into something like its usual calm. He wrote for some time in his diary, and all at once a line from one of his school copy-books flashed across his memory, and resolutely remained there. Unconsciously, he wrote it on the paper before him, 'Learn from your enemies.' Then it fascinated him, and he leaned back in his chair muttering: 'Learn from your enemies.' This familiar maxim it was that gave the final direction to thoughts that threatened to become chaotic. The sound of the words brought their significance, and he cried aloud: 'Yes, yes; that is it; I must learn from my enemies.'

After a considerable interval of perfectly sequential thinking, Mr Fox had arrived at this conclusion—that he and his friends were part-causes and part-effects of the excessive mania for speculation for some time at work in the financial world. That world was beguiled with stupendous sophisms, that were summoned to the quick test of validity. Ah! he saw clearly now that it was no local tempest threatening the existence of Fox, Smiles, and Naylum. A general clashing of the financial elements was beginning, in which thousands would be plunged into ruin. Instead of futile struggles to save the firm, he must save himself; Quick, Grosschnabel, all who were ranging themselves on the opposite side, were merely hinting to him to do likewise. It was

time which it covers is not stated. Here figure kangaroos, wallabies, wallaroos, dingoes, wild-cats, bandicoots and rats, eagle-hawks and snakes. In all, just upon eight thousand head. It must be remembered that this does not represent mere wanton slaughter, but is the effort of one individual to keep down certain animals, which by their alarming increase are so inimical to the colonists. It has become necessary by act of parliament to declare constant war against these creatures; and any one who will devote his time to their slaughter is made a welcome guest everywhere. It is suggested that those at home who may be tired of the quieter sports found here, would do well to take their guns and thin the kangaroos and other creatures that are found in Australia in such alarming numbers.

Herr Raphael of Breslau is manufacturing mica masks for the use of workmen who are engaged in occupations where injury to eyesight or the face generally is likely to occur. Noxious vapours, heat, dust, flying fragments, can thus be guarded against; whilst from the transparent nature of the mask, the workman can easily see what he is about. If desired, the head, neck, and shoulders of the operator can have the additional protection of a sheet of cloth impregnated with fireproof material, attached to the mask. And in certain cases where dangerous chemicals are in use, the addition of a breathing tube is desirable, which finds its exit over one of the shoulders.

The poetical surroundings of 'the village blacksmith' and his harmonious anvil are threatened with a powerful rival, by the introduction from the United States of a new industry, namely, the manufacture of machine-made horse-shoes. A Company, whose premises face the Thames opposite Greenwich, have just opened their works, to supply the United Kingdom with these machine-made articles. The iron is rolled from scrap, coming from the rollers as a grooved bar, which is afterwards cut into lengths, punched with the necessary holes, and finally is bent by a machine into the horseshoe shape. It is calculated that there are in the United Kingdom about three million horses; in Europe generally more than thirty million; requiring annually a million and a half tons of shoes. So that if the new Company turn out good work, there are plenty of customers for their goods. It is said that the new shoe has met with the approval of some eminent authorities, and is already used by several tramway Companies.

It is a curious anomaly that colonial sugar after leaving the country of its production as a manufactured article, should, when it reaches our shores, require to be boiled, melted, and in fact manufactured over again, before it assumes the 'lump' form. There exists more than one reason why the refined article is not produced on the spot, and these are due to defects in the apparatus employed, which hitherto it has been found

impossible to surmount. Mr F. A. Bonnefin, an experienced sugar-grower in Mauritius, has recently devised a system by which the sugar can be refined at the place where it is raised, and while the juice in the cane is fresh, and therefore in the best condition for treatment. The cane is first of all cut by vertical saws into slices, which, falling below the saw-frame, pass into a disintegrator, where they are rapidly reduced to pulp. By the action of rollers, this pulp is made to yield all its juice, which is then mixed with a certain proportion of lime. The viscid liquid is next caused to flow over a heated corrugated surface, where any solid impurities which it contains are made to fall into pockets or catch-pits. It is then subjected to filtration through a series of diaphragms of unspun cotton of the finest quality. The pure sirup thus obtained is next conducted to the ordinary vacuum pan, or to a special form of evaporator designed by Mr Bonnefin. The entire process only occupies one hour; while by the older methods from six to twelve hours elapsed before the cane took the form of white sugar. There are many other advantages connected with the new system, none the least of which is the avoidance of all chance of fermentation.

By the courtesy of Mr Elwin Streeter, we recently had the opportunity of seeing and handling what is supposed to be the most magnificent diamond ever discovered. It was found by Mr Porter Rhodes at his claim in the celebrated Kimberley Mine, South Africa. It is as yet uncut, and looks far more like a small lump of alum than the valuable gem it really is. Its weight is one hundred and fifty carats; and its owner, without mentioning the price he would demand for it, remarks that one hundred thousand pounds would not induce him to part with it. We understand that the most valuable diamonds are not, as generally thought, those which are perfectly colourless, but those which are known in the trade as 'blue diamonds.' The finest stone known of this description is valued at thirty thousand pounds. There is only one known specimen of a red diamond, a small but an expensive atom, for it is valued at eight hundred pounds. Additional interest will doubtless be manifested in Mr Rhodes' splendid prize when it comes to be 'cut.'

At a late meeting of the Balloon Society of Great Britain, Mr Woodbury read a most interesting paper on Balloon Photography. He first of all pointed out the extreme difficulty of procuring a photographic picture while the plate itself is in movement. With a steady camera, and an instantaneous shutter for opening and closing the lens in a fraction of a second, it is, by means of modern processes, comparatively easy to photograph an express train travelling at sixty miles an hour. Indeed, this has been done successfully more than once. Of course, there is no such thing as instantaneity, as even the quickest movement of any piece of apparatus must consume a certain amount of time. But in the case of the modern 'instantaneous shutter,' the movement would be so quick, that the express train in front would move forward very few inches during the same time, so that this movement would not be perceptible in the resulting

photograph. But if during exposure the camera itself be moved only the hundredth part of an inch, the effect upon the sensitive plate would be the same as if train and landscape had moved several yards, and a blur would be the result. Hence the difficulty of obtaining a photograph from a travelling balloon.

Notwithstanding these difficulties, Mr Woodbury anticipates that balloon photographs will be shortly produced, which will be of great value in many arts and sciences. Maps, of villages and towns, with every detail, perhaps every inhabitant, plainly depicted, will represent one use of the balloon camera. In exploring expeditions, it will denote the course of rivers and streams, even though hills intervene. But in warfare, its value will perhaps be greater than in any other service. The outline of fortifications and other defences could be rapidly obtained, the photograph being subsequently placed in a lantern, where its enlarged image would be projected on a screen. In a few minutes, by well-known means, an enlarged copy three or four feet square, giving indisputable evidence of the strength or weakness of the opposing force, would be at the disposal of the commander and his officers.

Although electricity is now applied to so many and such varied purposes, it would hardly be supposed that the manufacturer of porcelain could find any use for it in the preparation of his plastic paste. But at two important French works, a *Gramme* machine is found of great use in separating from the paste certain ferruginous particles, which, left alone, would give the resulting ware a bad colour and spotted appearance. The paste in a very liquid state is made to pass through the poles of a powerful electro-magnet, which gathers its force from the *Gramme* machine already mentioned. The minute particles of iron are, of course, attracted by the magnet, and the paste passes on robbed of these encumbrances.

In Italy, a new industry has arisen in the production of condensed grape juice, after the pattern of condensed milk. The juice is evaporated in a vacuum pan until it assumes the appearance of toffee, and is reduced to one-tenth of its former bulk. By careful attention to temperature, it retains all its fruit-acid and grape-sugar, and also those mineral components which are believed to exercise great influence in forming the qualities of wine. Where difficulties of transport are found, this condensing process will be of very great value, though what the excise authorities may have to say in the matter will remain to be seen.

Mr Bourbon, of Perpignan, has invented a new form of engine for dealing death and destruction to the dreaded phylloxera. It is a blowpipe flame fed by means of bellows with a constant and regulated supply of petroleum. It is directed against the vine; and while it carbonises the outer bark, does not injure the woody tissues. Of course, in this charring process every form of insect pest is destroyed; and the inventor confidently asserts that if for two successive years the treatment be adopted at a particular season, vineyards which may have been given up as useless, will be restored to full bearing.

Some interesting and highly important statistics relative to Pasteur's method of inoculating sheep

as a safeguard against splenic fever have recently been published. The number of animals treated was sixty-nine thousand, comprising one hundred and sixty flocks. Before vaccination, the losses by the disease amounted to no fewer than three thousand animals in the whole of the flock. During the vaccination process, the death-rate was reduced to one-third; and when the effects of vaccination were complete, the mortality from the disease fell to five.

During the recent gales, a large laburnum tree was uprooted in a field where some heifers were feeding. The rich foliage thus brought within their reach speedily attracted their attention, and they were soon busily engaged in devouring it. All, more or less, soon exhibited signs of poisoning, and some of them died. This result was not looked for, as it is known that the laburnum is a favourite food of hares and rabbits, and also that cattle have been known to feed upon it with impunity.

Sir John Lubbock has recently described some curious experiments bearing on the preference for certain colours exhibited by bees, and having reference to the important part which they play in removing pollen from one flower to another. He placed on a lawn small pieces of differently coloured paper, each paper having upon it drops of honey. By this means he found, after many observations, that the bees seemed to prefer blue to any other tint. This is a curious result, seeing that they have so much to do with the origin of flowers, blue flowers being more rarely found than those of any other colour. With reference to the longevity of ants, the same indefatigable observer remarks that he has some in his possession which have lived in confinement since the year 1874.

A tramway between Wisbeach and Upwell—a productive agricultural district—is about to be laid along the high-road by the Great Eastern Railway Company at a cost of twenty-five thousand pounds. Two or three bridges will, for the purposes of this line, have to be built over the Wisbeach Canal. This tramway represents an endeavour to solve the problem of sending farm produce to market expeditiously and cheaply, and the experiment will be watched with interest by all concerned. The line is to be worked by steam-engines of a light pattern, and will be available for both passengers and goods. The directors of the Company feel so sanguine of the financial success of their venture, that they have given notice of their intention to apply to parliament for powers to extend the same system to neighbouring parishes.

The Walton tramways, near Liverpool, have recently been the scene of some trials of different forms of steam-motors for street use, and they plainly show that light engines can be made both ornamental in appearance, and far more silent in their action than a tram-car drawn by horse-power. One of these motors consists of an arrangement combining engine and passenger car. It will carry twenty-two travellers, is free from heat, and silent in action. There is no doubt that in a short time both steam-motors and compressed-air engines will become common objects in our streets. Hitherto, the authorities have placed great restrictions on the use of steam, principally because horses are apt to take

fright at anything in the shape of 'puffing billy.' We are told that these experiments at Liverpool showed that most of the passing horses took no notice whatever of the intruders on their ground; though some certainly exhibited signs of fear. It might be useful, and we throw out the suggestion for what it is worth, to try and accustom horses to the sight of these motors before they come into active use. Military horses are soon accustomed to the sound of artillery, by constant practice; and there is no reason to suppose that their street brethren would not be equally tractable in the matter of steam.

An officer in one of the Revel fire brigades, whose name we are unable to ascertain, has invented a new form of fire extinguisher which is said to be very efficient in practice. It consists of a powder which, coming into contact with burning material, will give off such dense fumes that the fire itself is speedily stifled. After stopping up all openings in a burning house, a few boxes of this powder are thrown into the burning mass; and the fire, it is said, is soon overwhelmed by the fumes from the composition. The powder is by no means cheap; but if it be effective, its expense will not be considered.

The Director of the Geological Survey in Ireland, Professor Hull, has regretfully called attention to the fact that the Land Act and its provisions have been drawn up without taking advantage of the great help in the way of land valuation which can be derived from a study of his science. He reminds us that the productiveness of the soil is materially influenced by the substratum. Thus, the best grazing lands are situated on a calcareous subsoil; while an underlying stratum of granite, schist, or sandstone, will afford a surface soil that must be used for other purposes. Again, a subsoil of clay or shale will require an amount of money spent upon it for drainage which would not occur in the case of limestone or a singular porous foundation. People who wish to purchase land in Ireland under the new conditions of tenure will no doubt profit by the hints thus thrown out, more especially as they can for a very small sum purchase a map of the country, in which the different geological substrata are clearly defined.

'Some time since,' says *The London Figaro*, 'it was announced that the Admiralty had purchased a large quantity of the new luminous paint, and the popular idea was that it was to be used for the coating of guard-ships, buoys, floating magazines, and the like; with the result that the darker the night the more plainly visible would the various floating objects become. We have not yet heard, however, that this notion has been acted upon, though it certainly seems practical enough in its intention.' Our contemporary, after suggesting that various parts of the coast might be daubed with the paint for the sake of warning ships, throws out the hint that if lighthouses were thus rendered luminous, they would become veritable pillars of flame night after night. The suggestion seems worthy of a trial.

Experiments have lately been made in Texas with a new material for paper-making. This is the common cactus or prickly-pear, which in many parts of Texas is a rank weed, very troublesome to settlers, and hitherto quite useless. Judge E. F. Hall, of Laredo, has succeeded in

convincing capitalists that the cactus is capable of producing good paper-making materials, and machinery for its manufacture is now being made. If it should prove successful, it will give a great impetus to the American paper-manufacture, the raw material being so cheap and plentiful.

## OCCASIONAL NOTES.

### 'WHAT CAN WE DO WITH OUR YOUNGER SONS?'

THIS is a question of something like vital importance to a large section of the community. Under the operation of the laws of primogeniture and entail, the transmission of heritable, and more especially landed property, goes from father to child, preference being generally given to the eldest son or his heirs; and in this way the younger sons who are not in some business for themselves have necessarily to be content with such incomes as their parents are able to allot to them, these incomes in some cases being large, in others moderate, and in others next to nothing at all. In the last two cases, the younger son, if he is wise and his parents considerate, makes it his object, or ought to make it his object, to engage in some business or profession which may add to his income. But it does not happen that the younger sons of the well-born classes are all clever, any more than it happens in other classes; consequently, many expedients are resorted to with the view of enabling them to provide for themselves, or at least not to be a burden on their friends. One of the more favoured expedients of late has been—seeing that the practice of farming or cattle-rearing is unfortunately not yet fully recognised as a 'genteel occupation' at home—to ship off younger sons to follow these branches of business in some foreign country. When this has been done, the family somehow feel that they have done their duty by the young man at any rate, and the further results must lie with himself.

A needed note of warning in this matter has come from California, in the form of a letter, which appears in the *Spectator* of November 26, and a summary of which will, we feel sure, interest many of our readers. The Editor of that paper says the letter is 'from a source for the perfect trustworthiness of which we can answer;' and the communication bears internal evidence that it is written by a gentleman who is, as he says himself, in the small number of the 'lucky' ones who have gone out to the far West.

Referring to the numerous failures of younger sons to push their way out there in California, the writer says: 'The great reason, I think, why so many have come to no good here, is from the way in which fathers often ship off their sons like so many head of cattle, telling them that there is pasture enough somewhere in the land, and they must only wander about till they find it. I fear that while wandering they are very likely to fall into some of those pits that I have seen engulf many a hopeful young life.' He would not advise parents to send out any boy unless he were 'one of those creatures with a natural dislike to civilisation, never happy in society of any kind, but intensely fond of

"messing" about with animals and natural objects of all kinds; in which case the rough life would not disgust him, and his knowledge of animals, &c., would stand him in good stead for finding work. 'But a boy with no such knowledge, and with only the experience of life that school or business has given him, will almost certainly be compelled to try one trade after another, falling down at each step, till at the end of some years, he goes home again in despair, and you find your boy something between a "happy Hampton welsher" and a music-hall waiter.'

In despite, however, of the failings which he sees around him, the writer still thinks there are openings in California for the 'younger olive-branches.' But he warns parents of the kind of company with whom their sons must almost necessarily associate, and by whom they are almost certain to be degraded and rendered vicious. 'You cannot,' he says, 'conceive how frightfully easy it is for a young fellow to drift downwards in this country. You send your boy out here to find "something"; and he finds, as I did, University-men working in mines up to their waists in water, waiting in restaurants, acting in third-rate theatrical parts—doing, in short, everything and anything that would put bread into their mouths.' He points out how much of this degradation may be avoided. 'You English fathers must not send an ordinary boy out here with your blessing and one hundred pounds, to sink and swim for himself. *He will certainly and surely come to grief.* Let him have some one's house to come to at the first start; or still better, come with him yourself; the voyage is nothing now, and you would make acquaintance with a magnificent country; try and find a home for him in some respectable family; and if possible, wait with him till he has found some work. Then, do not lose your "grip" on him; send him letters and papers constantly from home, make him feel he has you to fall back upon in any scrape or difficulty; and then, I venture to predict, your boy will succeed, and in a few years you will have a man to be proud of.'

#### THE NEST OF THE HARVEST MOUSE.

The harvest mouse is one of those little creatures which, though spread over the greater part of Europe, very few persons may have seen. This is partly accounted for by its shy habits, its smallness of body, and quickness of movement. This elegant little creature is light orange-brown on the upper parts, and white underneath, and is chiefly peculiar for the character of the nests which it builds, of which it has two kinds, one for summer and one for winter. The summer nest, in which it rears its young, is generally found suspended at some height from the ground between stalks of corn or reeds—three or four of the stalks being utilised as supports, and held in their places by the intertwining of their pedicles or stalk-leaves. The nest, when finished, is about the size of a cricket-ball, very neat and compact, the framework being formed of wheat leaves or such-like, and described by Gilbert White as 'most artistically platted.' The interstices are comfortably filled in with moss; while a small round opening, only large enough to admit one's little finger, is left in the top, to give access to the interior of

the nest. Within the circumscribed space thus inclosed, as many as eight and nine young ones have been found at one time, and these so closely packed together that the rolling of the nest across a table could not dislodge them. There is little or no room for the mother inside; and how she manages to get so many little mouths filled from time to time is a wonder, as it seems impossible she can administer a teat to each. Here in this 'pendant bed and procrustean cradle,' swaying to and fro as the summer wind stirs among the wheat, the little creatures guard and nourish their tiny offspring, till they are ready to go forth and forage for themselves.

So much for the summer nest; the winter nest in some important respects differs from this. The cutting down of the corn in autumn leading to the destruction of their summer residences, and giving the little inmates immediate notice to quit, they look about for a place where they may build a winter nest, to which in the cold season they may retreat. Professor H. Schlegel has just described these winter nests as he found them in a locality near Leyden in 1868. Here there was a ditch some quarter of a mile in length, and six paces in width, part of the border of which was grown over with reeds. A careful examination showed that these reeds actually contained about fifty nests of the harvest mouse. These winter nests he found to be composed of various mosses. They were attached to and between several stems of reeds, exactly like the nests of the reed-warbler, but more tapered in form, of from six inches to a foot in height, and from three to four inches in diameter. They showed no inlet, and were placed at the height of a foot over the water's level. The little creature when entering had to remove the upper part of the covering, which was less densely interwoven, and was concealed between the moss. It would seem evident that the building of these nests was a just calculation of being safe against the danger of drowning.

#### PRINTERS' MISTAKES.

A delicious piece of bamboozlement was served up to the readers of a provincial paper the other day, due in all probability to some wag of a sub-editor. The previous evening, the reporter for the paper had to attend a meeting at a Wesleyan Chapel, for the conversion of the Jews to Christianity; after which he reported an address given to a local Society on the Conversion of Sewage into Lime and Cement. In the compositor's hands, the manuscript got mixed up, and the printed report read as follows: 'The chairman, after the meeting had been opened with prayer, explained that the conversion of the Jews was one of the greatest works that could engage the attention of our sanitary authorities. Filtration was the most perfect method that could be adopted for purification; but a filter had its limits. There was a popular notion that the sewage contained a vast amount of wealth; but the sludge must be taken out of it for purposes of irrigation, as it otherwise choked the pores of the land; and they were a wandering race, spread over the whole face of the habitable globe. They were denied the inestimable blessings of Christianity, which might be counted by thousands of tons

per year being allowed to run to waste, when, by a judicious admixture of lime and clay, the benighted Hebrews who sat in darkness might easily be converted into lime and cement for building purposes; and if thus deodorised, after being first dried and burned in a kiln, this ancient race would once more take its proud position among the nations of the world. Subscriptions were earnestly solicited for the purpose, though he—the speaker—disclaimed any idea of making a profit out of the process; and in conclusion he urged increasing efforts in the good work, showing that thus deodorised, by a very novel process of evangelisation, in large tanks constructed for the purpose, the grateful Hebrews might flow over the land without injury to vegetation; while the expense of conversion, which was progressing as rapidly as the best friends of Christianity could wish, would be more than repaid by the sale of the phosphate of lime and valuable cement for building purposes.

#### KINDNESS TO ANIMALS.

We have pleasure in drawing renewed attention to a most interesting monthly publication, called *The Animal World* (price 2d.), published by Partridge & Co., London, for the Royal Society for the Prevention of Cruelty to Animals. The publication referred to has been in existence for over twelve years, and its chief object is to teach humanity and kindness to animals, and to encourage the study of their habits and natures, so as the better to appreciate and admire the remarkable intelligence and docility which frequently distinguish them. The number before us for December 1st is what the editor calls 'a dog-number'—that is, it is mainly devoted to communications that narrate interesting anecdotes of canine sagacity and thoughtfulness, or plead for a more general improvement in the treatment dogs receive by being chained up for hours and days in back-courts, or sent long journeys by railway without any provision being made for having them supplied with water and food. The accounts here given of 'Railway Jack,' the London, Brighton, and South Coast Railway Dog, and of 'Briar,' a fire-preventing dog, are such as to awaken in the reader's mind a deeper sympathy for our dumb four-footed friends, who, denied by nature the gift of speech, have yet such resources of intelligence at their power as to be able to make for them their wants, desires, and affections, even about the more luminous medium of words. It is with the utmost pleasure and confidence that we recommend this beautifully illustrated 'Advocate of Humanity' to our readers, and especially to our young readers.

#### 'GOOD ADVICE TO SEAMEN.'

This little publication, of which the above is the title, is written by 'An Old Sailor' (Dundee: John Leng & Co.), and is evidently well adapted to secure the object of the author, which is to encourage among seamen 'a spirit of independence, self-reliance, and manliness.' In the distribution of his 'advice,' he does not omit the employers of the sailors or their officers, reminding the latter that the discipline and good conduct of the crew very much depend upon the example which their

superiors set them. Practical instructions are also given to sailors in regard to their principal duties; the dietary arrangements on board ship are discussed; sailors' grievances pointed out, and hints given for the remedy of them. They are specially warned against the 'crimps' and other land-sharks that lie in wait for them in the home-ports, to fleece them of their hard-earned wages. The Board of Trade has taken up arms against the whole class of 'crimps'—that is, men who, by making advances to the sailors upon the security of their wages, swindle them out of the most of their money; and according to our author, the happy result has been, in Dundee at least, that the crimp has been almost, if not quite driven out of the field. The author, who in the course of his little book recommends to sailors the use of oil at sea in a storm, has here given much valuable advice and many useful suggestions to sailors and those connected with them; and the booklet can scarcely fail to advance both the material and moral welfare of those who lay its teachings to heart.

#### WILD BEASTS AND SNAKES IN INDIA.

It is with somewhat more than ordinary interest that we have for some years past awaited the annual records setting forth the fearful ravages wrought by tigers and other wild animals, and by snakes, throughout our Indian empire. From a brief notice which appears in the columns of a contemporary, we now learn that there has been a steady decrease, from 1876 to 1880, in the total number of wild animals destroyed throughout Hindustan, coupled, however, with a proportionate increase in the number of persons killed by wild animals and snakes. Thus, whereas in the year first named there were destroyed in Hindustan no fewer than twenty-three thousand four hundred and fifty-nine wild beasts, in 1880 the figures diminished to fourteen thousand eight hundred and eighty-six; but, during this same period, the number of human beings who have lost their lives has mounted up from nineteen thousand two hundred and seventy-two, to twenty-one thousand nine hundred and ninety! One satisfactory feature observable in the present annual returns is that relating to the great increase in the number of snakes destroyed in the Bombay Presidency alone. Of course, it must be a matter of impossibility to suggest an antidote for the mortal injuries inflicted by a wild beast such as the tiger; but there would seem to be a good field now presented for the further prosecution of the experiments already made by Dr de Lacerda in connection with a specific for snake-bite.

#### 'CASTING BREAD ON THE WATERS.'

It is always pleasant to put on record instances of heroic self-sacrifice, and it is equally pleasant to put on record instances of gratitude on the part of those for whom such self-sacrifices were made. A correspondent sends us two advertisements which show in a remarkable manner how 'bread cast upon the waters' may return after many days. The first notification intimates that, 'If Benjamin or Andrew Binkin, who left London for the East Indies in 1839, and who saved the life of a lady passenger from being drowned, will apply to

—, he will hear of something to his advantage. If dead, his children will be entitled.' The second is even more definite: 'If Joseph Pearce, carpenter, formerly of Strond, and who was at the rebuilding of Daylesford Church in 1860, will apply to —, he will hear of a large property in land and cash left him by a lady whose life he saved at the risk of his own in 1846.' While the good we do should not be regulated by the mere prospect of reward that may follow; yet, when a good deed has been disinterestedly done, it is a pleasure to notice that the recipient has been grateful.

#### WHAT THE YEARS BRING.

Two sunny-haired and clear-voiced children stood  
Among the flowers all careless; sunshine played  
About their golden heads; and in the wood  
The birds rejoiced, and pleasant music made.  
Ah! Life's fresh morning is so gay and sweet.  
They cared not for the flowers beneath their feet.

A youth and maiden in the summer noon  
Wandered, and looked into each other's eyes,  
And thought that Love was such a priceless boon,  
That having it, no little cloud could rise  
Upon their sky—so radiant, when ye love,  
Grows earth around us, and the sky above.

Two happy lives, close welded into one;  
Bright children playing round them, and the light  
Of Love and Home, like to the blessed sun  
Shining about them, while the calm years' flight  
Brings only happiness, for Home and Love  
Are dear as heaven and the saints above.

One widowed heart, whose life-pulse beats alone;  
Children all fatherless, and hope all fled.  
What matter that she makes such bitter moan,  
Or shrouds in fruitless woe her golden head?  
The world goes by, all careless of her woe;  
Cold world, which ever treats our sorrows so!

A grave, where tender maidens come to weep,  
Bringing fresh garlands, when the old are dead.  
What matters it? Their love breaks not the sleep  
Of the quiet ears which hear no more their tread.  
Such are our little lives; but heaven is ours,  
When faded are our hopes, our loves and flowers.

J. H.

*Volume XVIII. of the Fourth Series of CHAMBERS'S JOURNAL is now completed, price Nine Shillings.*

*A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.*

*An elegant cloth case for binding the whole of the numbers for 1881 is also ready.*

*Back numbers to complete sets may at all times be had.*

*Next Saturday, January 7, 1882, will be presented the opening chapter of a Novel of powerful interest, entitled,*

#### VAL. STRANGE:

*A Story of the Primrose Valley.*

By DAVID CHRISTIE MURRAY,  
Author of *A Life's Attonement*, &c.

## OUR JUBILÉE YEAR, 1882.

In the Monthly Part to be issued at the end of January 1882, will appear an address to our readers, entitled,

### REMINISCENCES OF A LONG AND BUSY LIFE:

From the pen of Dr W. CHAMBERS, the Founder of  
*CHAMBERS'S JOURNAL.*

END OF EIGHTEENTH VOLUME.

Printed and Published by W. and R. Chambers,  
47 Paternoster Row, London, and 339 High Street, Edinburgh.

*All Rights Reserved.*
